DeePMD-kit is a package written in Python/C++, designed to minimize the effort required to build deep learning-based models of interatomic potential energy and force field and to perform molecular dynamics (MD). This brings new hopes to addressing the accuracy-versus-efficiency dilemma in molecular simulations. Applications of DeePMD-kit span from finite molecules to extended systems and from metallic systems to chemically bonded systems.

Important: The project DeePMD-kit is licensed under [GNU LGPLv3.0](#). If you use this code in any future publications, please cite this using Han Wang, Linfeng Zhang, Jiequn Han, and Weinan E. “DeePMD-kit: A deep learning package for many-body potential energy representation and molecular dynamics.” *Computer Physics Communications* 228 (2018): 178-184.

GETTING STARTED

In this text, we will call the deep neural network that is used to represent the interatomic interactions (Deep Potential) the model. The typical procedure of using DeePMD-kit is

1.1 Easy install

There are various easy methods to install DeePMD-kit. Choose one that you prefer. If you want to build by yourself, jump to the next two sections.

After your easy installation, DeePMD-kit (`dp`) and LAMMPS (`lmp`) will be available to execute. You can try `dp -h` and `lmp -h` to see the help. `mpirun` is also available considering you may want to train models or run LAMMPS in parallel.

Note: Note: The off-line packages and conda packages require the [GNU C Library 2.17](#) or above. The GPU version requires [compatible NVIDIA driver](#) to be installed in advance. It is possible to force conda to [override detection](#) when installation, but these requirements are still necessary during runtime.

- [Install off-line packages](#)
- [Install with conda](#)
- [Install with docker](#)
- [Install Python interface with pip](#)

1.1.1 Install off-line packages

Both CPU and GPU version offline packages are available in [the Releases page](#).

Some packages are split into two files due to size limit of GitHub. One may merge them into one after downloading:

```
cat deepmd-kit-2.1.1-cuda11.6_gpu-Linux-x86_64.sh.0 deepmd-kit-2.1.1-cuda11.6_gpu-Linux-x86_64.sh.  
↪1 > deepmd-kit-2.1.1-cuda11.6_gpu-Linux-x86_64.sh
```

One may enable the environment using

```
conda activate /path/to/deepmd-kit
```

1.1.2 Install with conda

DeePMD-kit is available with [conda](#). Install [Anaconda](#) or [Miniconda](#) first.

Official channel

One may create an environment that contains the CPU version of DeePMD-kit and LAMMPS:

```
conda create -n deepmd deepmd-kit==*cpu libdeepmd==*cpu lammps -c https://conda.deepmodeling.com┐  
└─c defaults
```

Or one may want to create a GPU environment containing [CUDA Toolkit](#):

```
conda create -n deepmd deepmd-kit==*gpu libdeepmd==*gpu lammps cudatoolkit=11.6 horovod -c┐  
└─https://conda.deepmodeling.com -c defaults
```

One could change the CUDA Toolkit version from 10.2 or 11.6.

One may specify the DeePMD-kit version such as 2.1.1 using

```
conda create -n deepmd deepmd-kit=2.1.1=*cpu libdeepmd=2.1.1=*cpu lammps horovod -c https://conda.┐  
└─deepmodeling.com -c defaults
```

One may enable the environment using

```
conda activate deepmd
```

conda-forge channel

DeePMD-kit is also available on the [conda-forge](#) channel:

```
conda create -n deepmd deepmd-kit lammps -c conda-forge
```

The supported platform includes Linux x86-64, macOS x86-64, and macOS arm64. Read [conda-forge FAQ](#) to learn how to install CUDA-enabled packages.

1.1.3 Install with docker

A docker for installing the DeePMD-kit is available [here](#).

To pull the CPU version:

```
docker pull ghcr.io/deepmodeling/deepmd-kit:2.1.1_cpu
```

To pull the GPU version:

```
docker pull ghcr.io/deepmodeling/deepmd-kit:2.1.1_cuda11.6_gpu
```

To pull the ROCm version:

```
docker pull deepmodeling/dpmdkit-rocm:dp2.0.3-rocm4.5.2-tf2.6-lmp29Sep2021
```

1.1.4 Install Python interface with pip

If you have no existing TensorFlow installed, you can use `pip` to install the pre-built package of the Python interface with CUDA 11 supported:

```
pip install deepmd-kit[gpu,cu11]
```

`cu11` is required only when CUDA Toolkit and cuDNN were not installed.

Or install the CPU version without CUDA supported:

```
pip install deepmd-kit[cpu]
```

The LAMMPS module and the i-Pi driver are only provided on Linux and macOS. To install LAMMPS and/or i-Pi, add `lmp` and/or `ipi` to extras:

```
pip install deepmd-kit[gpu,cu11,lmp,ipi]
```

MPICH is required for parallel running.

It is suggested to install the package into an isolated environment. The supported platform includes Linux x86-64 and aarch64 with GNU C Library 2.28 or above, macOS x86-64, and Windows x86-64. A specific version of TensorFlow which is compatible with DeePMD-kit will be also installed.

Warning: If your platform is not supported, or want to build against the installed TensorFlow, or want to enable ROCM support, please build from source.

1.2 Prepare data with dpdata

One can use a convenient tool `dpdata` to convert data directly from the output of first principle packages to the DeePMD-kit format.

To install one can execute

```
pip install dpdata
```

An example of converting data VASP data in OUTCAR format to DeePMD-kit data can be found at

```
$deepmd_source_dir/examples/data_conv
```

Switch to that directory, then one can convert data by using the following python script

```
import dpdata

dsys = dpdata.LabeledSystem("OUTCAR")
dsys.to("deepmd/npz", "deepmd_data", set_size=dsys.get_nframes())
```

`get_nframes()` method gets the number of frames in the OUTCAR, and the argument `set_size` enforces that the set size is equal to the number of frames in the system, viz. only one `set` is created in the `system`.

The data in DeePMD-kit format is stored in the folder `deepmd_data`.

A list of all supported data format and more nice features of `dpdata` can be found on the [official website](#).

1.3 Train a model

Several examples of training can be found in the `examples` directory:

```
$ cd $deepmd_source_dir/examples/water/se_e2_a/
```

After switching to that directory, the training can be invoked by

```
$ dp train input.json
```

where `input.json` is the name of the input script.

By default, the verbosity level of the DeePMD-kit is INFO, one may see a lot of important information on the code and environment showing on the screen. Among them two pieces of information regarding data systems are worth special notice.

```
DEEPMD INFO    ---Summary of DataSystem: training  -----
↪--
DEEPMD INFO    found 3 system(s):
DEEPMD INFO
DEEPMD INFO          system  natoms  bch_sz  n_bch  prob  pbc
DEEPMD INFO    ../data_water/data_0/    192    1    80  0.250  T
DEEPMD INFO    ../data_water/data_1/    192    1   160  0.500  T
DEEPMD INFO    ../data_water/data_2/    192    1    80  0.250  T
DEEPMD INFO    -----
↪--
DEEPMD INFO    ---Summary of DataSystem: validation -----
↪--
DEEPMD INFO    found 1 system(s):
DEEPMD INFO
DEEPMD INFO          system  natoms  bch_sz  n_bch  prob  pbc
DEEPMD INFO    ../data_water/data_3    192    1    80  1.000  T
DEEPMD INFO    -----
↪--
```

The DeePMD-kit prints detailed information on the training and validation data sets. The data sets are defined by `training_data` and `validation_data` defined in the `training` section of the input script. The training data set is composed of three data systems, while the validation data set is composed by one data system. The number of atoms, batch size, the number of batches in the system and the probability of using the system are all shown on the screen. The last column presents if the periodic boundary condition is assumed for the system.

During the training, the error of the model is tested every `disp_freq` training steps with the batch used to train the model and with `numb_btch` batches from the validating data. The training error and validation error are printed correspondingly in the file `disp_file` (default is `lcurve.out`). The batch size can be set in the input script by the key `batch_size` in the corresponding sections for the training and validation data set. An example of the output

#	step	rmse_val	rmse_trn	rmse_e_val	rmse_e_trn	rmse_f_val	rmse_f_trn	lr
	0	3.33e+01	3.41e+01	1.03e+01	1.03e+01	8.39e-01	8.72e-01	1.0e-03
	100	2.57e+01	2.56e+01	1.87e+00	1.88e+00	8.03e-01	8.02e-01	1.0e-03
	200	2.45e+01	2.56e+01	2.26e-01	2.21e-01	7.73e-01	8.10e-01	1.0e-03
	300	1.62e+01	1.66e+01	5.01e-02	4.46e-02	5.11e-01	5.26e-01	1.0e-03
	400	1.36e+01	1.32e+01	1.07e-02	2.07e-03	4.29e-01	4.19e-01	1.0e-03
	500	1.07e+01	1.05e+01	2.45e-03	4.11e-03	3.38e-01	3.31e-01	1.0e-03

The file contains 8 columns, from left to right, which are the training step, the validation loss, training loss, root mean square (RMS) validation error of energy, RMS training error of energy, RMS validation error of

force, RMS training error of force and the learning rate. The RMS error (RMSE) of the energy is normalized by the number of atoms in the system. One can visualize this file with a simple Python script:

```
import numpy as np
import matplotlib.pyplot as plt

data = np.genfromtxt("lcurve.out", names=True)
for name in data.dtype.names[1:-1]:
    plt.plot(data['step'], data[name], label=name)
plt.legend()
plt.xlabel('Step')
plt.ylabel('Loss')
plt.xscale('symlog')
plt.yscale('log')
plt.grid()
plt.show()
```

Checkpoints will be written to files with the prefix `save_ckpt` every `save_freq` training steps.

Warning: It is warned that the example water data (in folder `examples/water/data`) is of very limited amount, is provided only for testing purposes, and should not be used to train a production model.

1.4 Freeze a model

The trained neural network is extracted from a checkpoint and dumped into a protobuf(.pb) file. This process is called “freezing” a model. The idea and part of our code are from [Morgan](#). To freeze a model, typically one does

```
$ dp freeze -o graph.pb
```

in the folder where the model is trained. The output model is called `graph.pb`.

In [multi-task mode](#):

- This process will in default output several models, each of which contains the common descriptor and one of the user-defined fitting nets in `fitting_net_dict`, let's name it `fitting_key`, together frozen in `graph_{fitting_key}.pb`. Those frozen models are exactly the same as single-task output with fitting net `fitting_key`.
- If you add `--united-model` option in this situation, the total multi-task model will be frozen into one unit `graph.pb`, which is mainly for multi-task initialization and can not be used directly for inference.

1.5 Test a model

The frozen model can be used in many ways. The most straightforward test can be performed using `dp test`. A typical usage of `dp test` is

```
dp test -m graph.pb -s /path/to/system -n 30
```

where `-m` gives the tested model, `-s` the path to the tested system and `-n` the number of tested frames. Several other command line options can be passed to `dp test`, which can be checked with

```
$ dp test --help
```

An explanation will be provided

```
usage: dp test [-h] [-m MODEL] [-s SYSTEM] [-S SET_PREFIX] [-n NUMB_TEST]
              [-r RAND_SEED] [--shuffle-test] [-d DETAIL_FILE]

optional arguments:
  -h, --help            show this help message and exit
  -m MODEL, --model MODEL
                        Frozen model file to import
  -s SYSTEM, --system SYSTEM
                        The system dir
  -S SET_PREFIX, --set-prefix SET_PREFIX
                        The set prefix
  -n NUMB_TEST, --numb-test NUMB_TEST
                        The number of data for test
  -r RAND_SEED, --rand-seed RAND_SEED
                        The random seed
  --shuffle-test        Shuffle test data
  -d DETAIL_FILE, --detail-file DETAIL_FILE
                        The prefix to files where details of energy, force and virial accuracy/
                        accuracy per atom will be written
  -a, --atomic          Test the accuracy of atomic label, i.e. energy / tensor (dipole, polar)
```

1.6 Run MD with LAMMPS

Running an MD simulation with LAMMPS is simpler. In the LAMMPS input file, one needs to specify the pair style as follows

```
pair_style    deepmd graph.pb
pair_coeff    * * 0 H
```

where `graph.pb` is the file name of the frozen model. `pair_coeff` maps atom names (0 H) with LAMMPS atom types (integers from 1 to Ntypes, i.e. 1 2).

INSTALLATION

2.1 Easy install

There are various easy methods to install DeePMD-kit. Choose one that you prefer. If you want to build by yourself, jump to the next two sections.

After your easy installation, DeePMD-kit (`dp`) and LAMMPS (`lmp`) will be available to execute. You can try `dp -h` and `lmp -h` to see the help. `mpirun` is also available considering you may want to train models or run LAMMPS in parallel.

Note: Note: The off-line packages and conda packages require the [GNU C Library 2.17](#) or above. The GPU version requires [compatible NVIDIA driver](#) to be installed in advance. It is possible to force conda to [override detection](#) when installation, but these requirements are still necessary during runtime.

- [Install off-line packages](#)
- [Install with conda](#)
- [Install with docker](#)
- [Install Python interface with pip](#)

2.1.1 Install off-line packages

Both CPU and GPU version offline packages are available in [the Releases page](#).

Some packages are splited into two files due to size limit of GitHub. One may merge them into one after downloading:

```
cat deepmd-kit-2.1.1-cuda11.6_gpu-Linux-x86_64.sh.0 deepmd-kit-2.1.1-cuda11.6_gpu-Linux-x86_64.sh.  
↪1 > deepmd-kit-2.1.1-cuda11.6_gpu-Linux-x86_64.sh
```

One may enable the environment using

```
conda activate /path/to/deepmd-kit
```

2.1.2 Install with conda

DeePMD-kit is available with [conda](#). Install [Anaconda](#) or [Miniconda](#) first.

Official channel

One may create an environment that contains the CPU version of DeePMD-kit and LAMMPS:

```
conda create -n deepmd deepmd-kit==*cpu libdeepmd==*cpu lammps -c https://conda.deepmodeling.com
↪ -c defaults
```

Or one may want to create a GPU environment containing [CUDA Toolkit](#):

```
conda create -n deepmd deepmd-kit==*gpu libdeepmd==*gpu lammps cudatoolkit=11.6 horovod -c
↪ https://conda.deepmodeling.com -c defaults
```

One could change the CUDA Toolkit version from 10.2 or 11.6.

One may specify the DeePMD-kit version such as 2.1.1 using

```
conda create -n deepmd deepmd-kit=2.1.1=*cpu libdeepmd=2.1.1=*cpu lammps horovod -c https://conda.
↪ deepmodeling.com -c defaults
```

One may enable the environment using

```
conda activate deepmd
```

conda-forge channel

DeePMD-kit is also available on the [conda-forge](#) channel:

```
conda create -n deepmd deepmd-kit lammps -c conda-forge
```

The supported platform includes Linux x86-64, macOS x86-64, and macOS arm64. Read [conda-forge FAQ](#) to learn how to install CUDA-enabled packages.

2.1.3 Install with docker

A docker for installing the DeePMD-kit is available [here](#).

To pull the CPU version:

```
docker pull ghcr.io/deepmodeling/deepmd-kit:2.1.1_cpu
```

To pull the GPU version:

```
docker pull ghcr.io/deepmodeling/deepmd-kit:2.1.1_cuda11.6_gpu
```

To pull the ROCm version:

```
docker pull deepmodeling/dpmdkit-rocm:dp2.0.3-rocm4.5.2-tf2.6-lmp29Sep2021
```

2.1.4 Install Python interface with pip

If you have no existing TensorFlow installed, you can use `pip` to install the pre-built package of the Python interface with CUDA 11 supported:

```
pip install deepmd-kit[gpu,cu11]
```

`cu11` is required only when CUDA Toolkit and cuDNN were not installed.

Or install the CPU version without CUDA supported:

```
pip install deepmd-kit[cpu]
```

The [LAMMPS module](#) and the [i-Pi driver](#) are only provided on Linux and macOS. To install LAMMPS and/or i-Pi, add `lmp` and/or `ipi` to extras:

```
pip install deepmd-kit[gpu,cu11,lmp,ipi]
```

MPICH is required for parallel running.

It is suggested to install the package into an isolated environment. The supported platform includes Linux x86-64 and aarch64 with GNU C Library 2.28 or above, macOS x86-64, and Windows x86-64. A specific version of TensorFlow which is compatible with DeePMD-kit will be also installed.

Warning: If your platform is not supported, or want to build against the installed TensorFlow, or want to enable ROCm support, please [build from source](#).

2.2 Install from source code

Please follow our [GitHub](#) webpage to download the [latest released version](#) and [development version](#).

Or get the DeePMD-kit source code by `git clone`

```
cd /some/workspace
git clone --recursive https://github.com/deepmodeling/deepmd-kit.git deepmd-kit
```

The `--recursive` option clones all [submodules](#) needed by DeePMD-kit.

For convenience, you may want to record the location of the source to a variable, saying `deepmd_source_dir` by

```
cd deepmd-kit
deepmd_source_dir=`pwd`
```

2.2.1 Install the python interface

Install Tensorflow's python interface

First, check the python version on your machine

```
python --version
```

We follow the virtual environment approach to install TensorFlow's Python interface. The full instruction can be found on the official [TensorFlow website](#). TensorFlow 1.8 or later is supported. Now we assume that the Python interface will be installed to the virtual environment directory `$tensorflow_venv`

```
virtualenv -p python3 $tensorflow_venv
source $tensorflow_venv/bin/activate
pip install --upgrade pip
pip install --upgrade tensorflow
```

It is important that every time a new shell is started and one wants to use DeePMD-kit, the virtual environment should be activated by

```
source $tensorflow_venv/bin/activate
```

if one wants to skip out of the virtual environment, he/she can do

```
deactivate
```

If one has multiple python interpreters named something like python3.x, it can be specified by, for example

```
virtualenv -p python3.7 $tensorflow_venv
```

If one does not need the GPU support of DeePMD-kit and is concerned about package size, the CPU-only version of TensorFlow should be installed by

```
pip install --upgrade tensorflow-cpu
```

To verify the installation, run

```
python -c "import tensorflow as tf;print(tf.reduce_sum(tf.random.normal([1000, 1000])))"
```

One should remember to activate the virtual environment every time he/she uses DeePMD-kit.

One can also [build the TensorFlow Python interface from source](#) for custom hardware optimization, such as CUDA, ROCM, or OneDNN support.

Install the DeePMD-kit's python interface

Check the compiler version on your machine

```
gcc --version
```

The compiler GCC 4.8 or later is supported in the DeePMD-kit. Note that TensorFlow may have specific requirements for the compiler version. It is recommended to use the same compiler version as TensorFlow, which can be printed by `python -c "import tensorflow;print(tensorflow.version.COMPILER_VERSION)"`.

Execute

```
cd $deepmd_source_dir
pip install .
```

One may set the following environment variables before executing `pip`:

Environment variables	Allowed value	Default value	Usage
DP_VARIANT	cpu, cuda, rocm	cpu	Build CPU variant or GPU variant with CUDA or ROCM support.
CUDA_TOOLKIT_PATH	Path	Detected automatically	The path to the CUDA toolkit directory. CUDA 7.0 or later is supported. NVCC is required.
ROCM_TOOLKIT_PATH	Path	Detected automatically	The path to the ROCM toolkit directory.
TENSORFLOW_PATH	Path	Detected automatically	The path to TensorFlow Python library. By default the installer only finds TensorFlow under user site-package directory (<code>site.getusersitepackages()</code>) or system site-package directory (<code>sysconfig.get_path("purelib")</code>) due to limitation of PEP-517 . If not found, the latest TensorFlow (or the environment variable <code>TENSORFLOW_VERSION</code> if given) from PyPI will be built against.
DP_ENABLE_NATIVE_OPTIMIZATION	0, 1	0	Enable compilation optimization for the native machine's CPU type. Do not enable it if generated code will run on different CPUs.

To test the installation, one should first jump out of the source directory

```
cd /some/other/workspace
```

then execute

```
dp -h
```

It will print the help information like

```
usage: dp [-h] {train,freeze,test} ...

DeePMD-kit: A deep learning package for many-body potential energy
representation and molecular dynamics

optional arguments:
  -h, --help            show this help message and exit
```

(continues on next page)

(continued from previous page)

```
Valid subcommands:
{train,freeze,test}
  train      train a model
  freeze     freeze the model
  test       test the model
```

Install horovod and mpi4py

Horovod and mpi4py are used for parallel training. For better performance on GPU, please follow the tuning steps in [Horovod on GPU](#).

```
# With GPU, prefer NCCL as a communicator.
HOROVOD_WITHOUT_GLOO=1 HOROVOD_WITH_TENSORFLOW=1 HOROVOD_GPU_OPERATIONS=NCCL HOROVOD_NCCL_HOME=/
path/to/nccl pip install horovod mpi4py
```

If your work in a CPU environment, please prepare runtime as below:

```
# By default, MPI is used as communicator.
HOROVOD_WITHOUT_GLOO=1 HOROVOD_WITH_TENSORFLOW=1 pip install horovod mpi4py
```

To ensure Horovod has been built with proper framework support enabled, one can invoke the `horovodrun --check-build` command, e.g.,

```
$ horovodrun --check-build

Horovod v0.22.1:

Available Frameworks:
  [X] TensorFlow
  [X] PyTorch
  [ ] MXNet

Available Controllers:
  [X] MPI
  [X] Gloo

Available Tensor Operations:
  [X] NCCL
  [ ] DDL
  [ ] CCL
  [X] MPI
  [X] Gloo
```

From version 2.0.1, Horovod and mpi4py with MPICH support are shipped with the installer.

If you don't install Horovod, DeePMD-kit will fall back to serial mode.

2.2.2 Install the C++ interface

If one does not need to use DeePMD-kit with Lammmps or I-Pi, then the python interface installed in the previous section does everything and he/she can safely skip this section.

Install Tensorflow's C++ interface

The C++ interface of DeePMD-kit was tested with compiler GCC ≥ 4.8 . It is noticed that the I-Pi support is only compiled with GCC ≥ 4.8 . Note that TensorFlow may have specific requirements for the compiler version.

First, the C++ interface of Tensorflow should be installed. It is noted that the version of Tensorflow should be consistent with the python interface. You may follow the instruction or run the script `$deepmd_source_dir/source/install/build_tf.py` to install the corresponding C++ interface.

Install DeePMD-kit's C++ interface

Now go to the source code directory of DeePMD-kit and make a building place.

```
cd $deepmd_source_dir/source
mkdir build
cd build
```

I assume you want to install DeePMD-kit into path `$deepmd_root`, then execute CMake

```
cmake -DTENSORFLOW_ROOT=$tensorflow_root -DCMAKE_INSTALL_PREFIX=$deepmd_root ..
```

where the variable `tensorflow_root` stores the location where TensorFlow's C++ interface is installed.

One may add the following arguments to `cmake`:

CMake Arguments	Allowed value	Default value	Usage
- DTENSORFLOW_ROOT	Path	-	The Path to TensorFlow's C++ interface.
- DCMAKE_INSTALL_PATH	Path	-	The Path where DeePMD-kit will be installed.
- DUSE_CUDA_TOOLKIT	TRUE or FALSE	FALSE	If TRUE, Build GPU support with CUDA toolkit.
- DCUDA_TOOLKIT_PATH	Path	Detected automatically	The path to the CUDA toolkit directory. CUDA 7.0 or later is supported. NVCC is required.
- DUSE_ROCM_TOOLKIT	TRUE or FALSE	FALSE	If TRUE, Build GPU support with ROCM toolkit.
- DCMAKE_HIP_PATH	Path	Detected automatically	The path to the ROCM toolkit directory.
- DLAMMPS_SOURCE	Path	-	Only necessary for LAMMPS plugin mode. The path to the LAMMPS source code . LAMMPS 8Apr2021 or later is supported. If not assigned, the plugin mode will not be enabled.
- DUSE_TF_PYTHON	TRUE or FALSE	FALSE	If TRUE, Build C++ interface with TensorFlow's Python libraries(TensorFlow's Python Interface is required). And there's no need for building TensorFlow's C++ interface.
- DENABLE_NATIVE	TRUE or FALSE	FALSE	Enable compilation optimization for the native machine's CPU type. Do not enable it if generated code will run on different CPUs.

If the CMake has been executed successfully, then run the following make commands to build the package:

```
make -j4
make install
```

Option -j4 means using 4 processes in parallel. You may want to use a different number according to your hardware.

If everything works fine, you will have the following executable and libraries installed in \$deepmd_root/bin and \$deepmd_root/lib

```
$ ls $deepmd_root/bin
dp_ipi      dp_ipi_low
$ ls $deepmd_root/lib
libdeepmd_cc_low.so  libdeepmd_ipi_low.so  libdeepmd_lmp_low.so  libdeepmd_low.so
↳ libdeepmd_op_cuda.so  libdeepmd_op.so
libdeepmd_cc.so      libdeepmd_ipi.so      libdeepmd_lmp.so      libdeepmd_op_cuda_low.so
↳ libdeepmd_op_low.so  libdeepmd.so
```

2.3 Install LAMMPS

There are two ways to install LAMMPS: the built-in mode and the plugin mode. The built-in mode builds LAMMPS along with the DeePMD-kit and DeePMD-kit will be loaded automatically when running LAMMPS. The plugin mode builds LAMMPS and a plugin separately, so one needs to use `plugin load` command to load the DeePMD-kit's LAMMPS plugin library.

2.3.1 Install LAMMPS's DeePMD-kit module (built-in mode)

Before following this section, [DeePMD-kit C++ interface](#) should have been installed.

DeePMD-kit provides a module for running MD simulations with LAMMPS. Now make the DeePMD-kit module for LAMMPS.

```
cd $deepmd_source_dir/source/build
make lammps
```

DeePMD-kit will generate a module called `USER-DEEPM` in the `build` directory. If you need the low-precision version, move `env_low.sh` to `env.sh` in the directory. Now download the LAMMPS code, and uncompress it.

```
cd /some/workspace
wget https://github.com/lammps/lammps/archive/stable_23Jun2022_update3.tar.gz
tar xf stable_23Jun2022_update3.tar.gz
```

The source code of LAMMPS is stored in the directory `lammps-stable_23Jun2022_update3`. Now go into the LAMMPS code and copy the DeePMD-kit module like this

```
cd lammps-stable_23Jun2022_update3/src/
cp -r $deepmd_source_dir/source/build/USER-DEEPM .
make yes-kSPACE
make yes-extra-fix
make yes-user-deepmd
```

You can enable any other package you want. Now build LAMMPS

```
make mpi -j4
```

If everything works fine, you will end up with an executable `lmp_mpi`.

```
./lmp_mpi -h
```

The DeePMD-kit module can be removed from the LAMMPS source code by

```
make no-user-deepmd
```

2.3.2 Install LAMMPS (plugin mode)

Starting from 8Apr2021, LAMMPS also provides a plugin mode, allowing one to build LAMMPS and a plugin separately.

Now download the LAMMPS code (8Apr2021 or later), and uncompress it:

```
cd /some/workspace
wget https://github.com/lammps/lammps/archive/stable_23Jun2022_update3.tar.gz
tar xf stable_23Jun2022_update3.tar.gz
```

The source code of LAMMPS is stored in the directory `lammps-stable_23Jun2022_update3`. The directory of the source code should be specified as the CMAKE argument `LAMMPS_SOURCE_ROOT` during installation of the DeePMD-kit C++ interface. Now go into the LAMMPS directory and create a directory called `build`

```
mkdir -p lammps-stable_23Jun2022_update3/build/
cd lammps-stable_23Jun2022_update3/build/
```

Now build LAMMPS. Note that `PLUGIN` and `KSPACE` packages must be enabled, and `BUILD_SHARED_LIBS` must be set to `yes`. You can install any other package you want.

```
cmake -D PKG_PLUGIN=ON -D PKG_KSPACE=ON -D LAMMPS_INSTALL_RPATH=ON -D BUILD_SHARED_LIBS=yes -D_
↪CMAKE_INSTALL_PREFIX=${deepmd_root} -D CMAKE_INSTALL_LIBDIR=lib -D CMAKE_INSTALL_FULL_LIBDIR=$
↪{deepmd_root}/lib ../cmake
make -j4
make install
```

If everything works fine, you will end up with an executable `${deepmd_root}/bin/lmp`.

```
${deepmd_root}/bin/lmp -h
```

Note: If `${tensorflow_root}` or `${deepmd_root}` is different from the prefix of LAMMPS, you need to append the library path to `RUNPATH` of `liblammps.so`. For example,

```
patchelf --set-rpath "${tensorflow_root}/lib" liblammps.so
```

2.4 Install i-PI

The i-PI works in a client-server model. The i-PI provides the server for integrating the replica positions of atoms, while the DeePMD-kit provides a client named `dp_ipi` that computes the interactions (including energy, forces and virials). The server and client communicate via the Unix domain socket or the Internet socket. Full documentation for i-PI can be found [here](#). The source code and a complete installation guide for i-PI can be found [here](#). To use i-PI with already existing drivers, install and update using Pip:

```
pip install -U i-PI
```

Test with Pytest:

```
pip install pytest
pytest --pyargs ipi.tests
```

2.5 Install GROMACS with DeePMD

Before following this section, DeePMD-kit C++ interface should have be installed.

2.5.1 Patch source code of GROMACS

Download the source code of a supported GROMACS version (2020.2) from <https://manual.gromacs.org/2020.2/download.html>. Run the following command:

```
export PATH=$PATH:$deepmd_kit_root/bin
dp_gmx_patch -d $gromacs_root -v $version -p
```

where `deepmd_kit_root` is the directory where the latest version of DeePMD-kit is installed, and `gromacs_root` refers to the source code directory of GROMACS. And `version` represents the version of GROMACS, where only 2020.2 is supported now. If attempting to patch another version of GROMACS you will still need to set `version` to 2020.2 as this is the only supported version, we cannot guarantee that patching other versions of GROMACS will work.

2.5.2 Compile GROMACS with deepmd-kit

The C++ interface of Deepmd-kit 2.x and TensorFlow 2.x are required. And be aware that only DeePMD-kit with high precision is supported now since we cannot ensure single precision is enough for a GROMACS simulation. Here is a sample compile script:

```
#!/bin/bash
export CC=/usr/bin/gcc
export CXX=/usr/bin/g++
export CMAKE_PREFIX_PATH="/path/to/fftw-3.3.9" # fftw libraries
mkdir build
cd build

cmake3 .. -DCMAKE_CXX_STANDARD=14 \ # not required, but c++14 seems to be more compatible with ↵
↵ higher version of tensorflow
    -DGMX_MPI=ON \
    -DGMX_GPU=CUDA \ # Gromacs on ROCm has not been fully developed yet
    -DCUDA_TOOLKIT_ROOT_DIR=/path/to/cuda \
    -DCMAKE_INSTALL_PREFIX=/path/to/gromacs-2020.2-deepmd

make -j
make install
```

2.6 Building conda packages

One may want to keep both convenience and personalization of the DeePMD-kit. To achieve this goal, one can consider building conda packages. We provide building scripts in [deepmd-kit-recipes organization](#). These building tools are driven by [conda-build](#) and [conda-smithy](#).

For example, if one wants to turn on MPIIO package in LAMMPS, go to [lammps-feedstock](#) repository and modify `recipe/build.sh`. `-D PKG_MPIIO=OFF` should be changed to `-D PKG_MPIIO=ON`. Then go to the main directory and execute

```
./build-locally.py
```

This requires that Docker has been installed. After the building, the packages will be generated in `build_artifacts/linux-64` and `build_artifacts/noarch`, and then one can install then executing

```
conda create -n deepmd lammps -c file:///path/to/build_artifacts -c https://conda.deepmodeling.com
↳ -c nvidia
```

One may also upload packages to one's Anaconda channel, so they can be installed on other machines:

```
anaconda upload /path/to/build_artifacts/linux-64/*.tar.bz2 /path/to/build_artifacts/noarch/*.tar.
↳ bz2
```

DATA

In this section, we will introduce how to convert the DFT-labeled data into the data format used by DeePMD-kit.

The DeePMD-kit organizes data in **systems**. Each **system** is composed of a number of **frames**. One may roughly view a **frame** as a snapshot of an MD trajectory, but it does not necessarily come from an MD simulation. A **frame** records the coordinates and types of atoms, cell vectors if the periodic boundary condition is assumed, energy, atomic forces and virials. It is noted that the **frames** in one **system** share the same number of atoms with the same type.

3.1 System

DeePMD-kit takes a system as the data structure. A snapshot of a system is called a frame. A system may contain multiple frames with the same atom types and numbers, i.e. the same formula (like H₂O). To contains data with different formulas, one usually needs to divide data into multiple systems, which may sometimes result in sparse-frame systems. See a [new system format](#) to further combine different systems with the same atom numbers, when training with descriptor `se_atten`.

A system should contain system properties, input frame properties, and labeled frame properties. The system property contains the following property:

ID	Property	Raw file	Require	Shape	Description
type	Atom type indexes	type.raw	Require	Natom	Integers that start with 0. If both the training parameter <code>type_map</code> is set and <code>type_map.raw</code> is provided, the system atom type should be mapped to <code>type_map.raw</code> in <code>type.raw</code> and will be mapped to the model atom type when training; otherwise, the system atom type will be always mapped to the model atom type (whether <code>type_map</code> is set or not)
type	Atom type name	type	Optional	Ntype	Atom names that map to atom type, which is unnecessary to be contained in the periodic table. Only works when the training parameter <code>type_map</code> is set
nonp	Non-periodic system	nonp	Optional	1	If True, this system is non-periodic; otherwise it's periodic

The input frame properties contain the following property, the first axis of which is the number of frames:

ID	Property	Raw file	Unit	Re-quired/Opti	Shape	Description
coord	Atomic coordinates	co-ord.raw	Å	Required	Nframes * Natoms * 3	
box	Boxes	box.raw	Å	Required if periodic	Nframes * 3 * 3	in the order XX XY XZ YX YY YZ ZX ZY ZZ
fparam	Extra frame parameters	fparam.	Any	Optional	Nframes * Any	
aparam	Extra atomic parameters	aparam	Any	Optional	Nframes * aparam * Any	
numb_copy	Each frame is copied by the numb_copy (int) times	prob.ra	1	Optional	Nframes	Integer; Default is 1 for all frames

The labeled frame properties are listed as follows, all of which will be used for training if and only if the loss function contains such property:

ID	Property	Raw file	Unit	Shape	Description
energy	Frame energies	energy.raw	eV	Nframes	
force	Atomic forces	force.raw	eV/Å	Nframes * Natoms * 3	
virial	Frame virial	virial.raw	eV	Nframes * 9	in the order XX XY XZ YX YY YZ ZX ZY ZZ
atom_ener	Atomic energies	atom_ener.raw	eV	Nframes * Natoms	
atom_pref	Weights of atomic forces	atom_pref.raw	1	Nframes * Natoms	
dipole	Frame dipole	dipole.raw	Any	Nframes * 3	
atomic_dipole	Atomic dipole	atomic_dipole.raw	Any	Nframes * Natoms * 3	
polarizability	Frame polarizability	polarizability.raw	Any	Nframes * 9	in the order XX XY XZ YX YY YZ ZX ZY ZZ
atomic_polariz	Atomic polarizability	atomic_polarizabi	Any	Nframes * Natoms * 9	in the order XX XY XZ YX YY YZ ZX ZY ZZ

In general, we always use the following convention of units:

Property	Unit
Time	ps
Length	Å
Energy	eV
Force	eV/Å
Virial	eV
Pressure	Bar

3.2 Formats of a system

Two binary formats, NumPy and HDF5, are supported for training. The raw format is not directly supported, but a tool is provided to convert data from the raw format to the NumPy format.

3.2.1 NumPy format

In a system with the Numpy format, the system properties are stored as text files ending with `.raw`, such as `type.raw` and `type_map.raw`, under the system directory. If one needs to train a non-periodic system, an empty `nopbc` file should be put under the system directory. Both input and labeled frame properties are saved as the [NumPy binary data \(NPY\) files](#) ending with `.npz` in each of the `set.*` directories. Take an example, a system may contain the following files:

```
type.raw
type_map.raw
nopbc
set.000/coord.npz
set.000/energy.npz
set.000/force.npz
set.001/coord.npz
set.001/energy.npz
set.001/force.npz
```

We assume that the atom types do not change in all frames. It is provided by `type.raw`, which has one line with the types of atoms written one by one. The atom types should be integers. For example the `type.raw` of a system that has 2 atoms with 0 and 1:

```
$ cat type.raw
0 1
```

Sometimes one needs to map the integer types to atom names. The mapping can be given by the file `type_map.raw`. For example

```
$ cat type_map.raw
0 H
```

The type 0 is named by "0" and the type 1 is named by "H".

For training models with descriptor `se_atten`, a [new system format](#) is supported to put together the frame-sparse systems with the same atom number.

3.2.2 HDF5 format

A system with the HDF5 format has the same structure as the Numpy format, but in an HDF5 file, a system is organized as an [HDF5 group](#). The file name of a Numpy file is the key in an HDF5 file, and the data is the value of the key. One needs to use `#` in a DP path to divide the path to the HDF5 file and the HDF5 path:

```
/path/to/data.hdf5#/H2O
```

Here, `/path/to/data.hdf5` is the file path and `/H2O` is the HDF5 path. All HDF5 paths should start with `/`. There should be some data in the H2O group, such as `/H2O/type.raw` and `/H2O/set.000/force.npz`.

An HDF5 file with a large number of systems has better performance than multiple NumPy files in a large cluster.

3.2.3 Raw format and data conversion

A raw file is a plain text file with each information item written in one file and one frame written on one line. It's not directly supported, but we provide a tool to convert them.

In the raw format, the property of one frame is provided per line, ending with `.raw`. Take an example, the default files that provide box, coordinate, force, energy and virial are `box.raw`, `coord.raw`, `force.raw`, `energy.raw` and `virial.raw`, respectively. Here is an example of `force.raw`:

```
$ cat force.raw
-0.724  2.039 -0.951  0.841 -0.464  0.363
 6.737  1.554 -5.587 -2.803  0.062  2.222
-1.968 -0.163  1.020 -0.225 -0.789  0.343
```

This `force.raw` contains 3 frames with each frame having the forces of 2 atoms, thus it has 3 lines and 6 columns. Each line provides all the 3 force components of 2 atoms in 1 frame. The first three numbers are the 3 force components of the first atom, while the second three numbers are the 3 force components of the second atom. Other files are organized similarly. The number of lines of all raw files should be identical.

One can use the script `$deepmd_source_dir/data/raw/raw_to_set.sh` to convert the prepared raw files to the NumPy format. For example, if we have a raw file that contains 6000 frames,

```
$ ls
box.raw coord.raw energy.raw force.raw type.raw virial.raw
$ $deepmd_source_dir/data/raw/raw_to_set.sh 2000
nframe is 6000
nline per set is 2000
will make 3 sets
making set 0 ...
making set 1 ...
making set 2 ...
$ ls
box.raw coord.raw energy.raw force.raw set.000 set.001 set.002 type.raw virial.raw
```

It generates three sets `set.000`, `set.001` and `set.002`, with each set containing 2000 frames in the Numpy format.

3.3 Prepare data with dpdata

One can use a convenient tool `dpdata` to convert data directly from the output of first principle packages to the DeePMD-kit format.

To install one can execute

```
pip install dpdata
```

An example of converting data `VASP` data in `OUTCAR` format to DeePMD-kit data can be found at

```
$deepmd_source_dir/examples/data_conv
```

Switch to that directory, then one can convert data by using the following python script

```
import dpdata

dsys = dpdata.LabeledSystem("OUTCAR")
dsys.to("deepmd/npz", "deepmd_data", set_size=dsys.get_nframes())
```

`get_nframes()` method gets the number of frames in the OUTCAR, and the argument `set_size` enforces that the set size is equal to the number of frames in the system, viz. only one `set` is created in the `system`.

The data in DeePMD-kit format is stored in the folder `deepmd_data`.

A list of all [supported data format](#) and more nice features of `dpdata` can be found on the [official website](#).

4.1 Overall

A model has two parts, a descriptor that maps atomic configuration to a set of symmetry invariant features, and a fitting net that takes descriptor as input and predicts the atomic contribution to the target physical property. It's defined in the `model` section of the `input.json`, for example,

```
"model": {
  "type_map":      ["O", "H"],
  "descriptor": {
    "...": "..."
  },
  "fitting_net": {
    "...": "..."
  }
}
```

The two subsections, `descriptor` and `fitting_net`, define the descriptor and the fitting net, respectively.

The `type_map` is optional, which provides the element names (but not necessarily same as the actual name of the element) of the corresponding atom types. A water model, as in this example, has two kinds of atoms. The atom types are internally recorded as integers, e.g., 0 for oxygen and 1 for hydrogen here. A mapping from the atom type to their names is provided by `type_map`.

DeePMD-kit implements the following descriptors:

1. `se_e2_a`: DeepPot-SE constructed from all information (both angular and radial) of atomic configurations. The embedding takes the distance between atoms as input.
2. `se_e2_r`: DeepPot-SE constructed from radial information of atomic configurations. The embedding takes the distance between atoms as input.
3. `se_e3`: DeepPot-SE constructed from all information (both angular and radial) of atomic configurations. The embedding takes angles between two neighboring atoms as input.
4. `se_a_mask`: DeepPot-SE constructed from all information (both angular and radial) of atomic configurations. The input frames in one system can have a varied number of atoms. Input particles are padded with virtual particles of the same length.
5. `loc_frame`: Defines a local frame at each atom and compute the descriptor as local coordinates under this frame.
6. `hybrid`: Concatenate a list of descriptors to form a new descriptor.

The fitting of the following physical properties is supported

1. *ener*: Fit the energy of the system. The force (derivative with atom positions) and the virial (derivative with the box tensor) can also be trained.
2. *dipole*: The dipole moment.
3. *polar*: The polarizability.

4.2 Descriptor "se_e2_a"

The notation of `se_e2_a` is short for the Deep Potential Smooth Edition (DeepPot-SE) constructed from all information (both angular and radial) of atomic configurations. The `e2` stands for the embedding with two-atoms information. This descriptor was described in detail in [the DeepPot-SE paper](#).

Note that it is sometimes called a “two-atom embedding descriptor” which means the input of the embedding net is atomic distances. The descriptor does encode multi-body information (both angular and radial information of neighboring atoms).

In this example, we will train a DeepPot-SE model for a water system. A complete training input script of this example can be found in the directory.

```
$deepmd_source_dir/examples/water/se_e2_a/input.json
```

With the training input script, data are also provided in the example directory. One may train the model with the DeePMD-kit from the directory.

The construction of the descriptor is given by section [descriptor](#). An example of the descriptor is provided as follows

```
"descriptor" :{
  "type":          "se_e2_a",
  "rcut_smth":     0.50,
  "rcut":          6.00,
  "sel":           [46, 92],
  "neuron":        [25, 50, 100],
  "type_one_side": true,
  "axis_neuron":   16,
  "resnet_dt":     false,
  "seed":          1
}
```

- The `type` of the descriptor is set to `"se_e2_a"`.
- `rcut` is the cut-off radius for neighbor searching, and the `rcut_smth` gives where the smoothing starts.
- `sel` gives the maximum possible number of neighbors in the cut-off radius. It is a list, the length of which is the same as the number of atom types in the system, and `sel[i]` denotes the maximum possible number of neighbors with type `i`.
- The `neuron` specifies the size of the embedding net. From left to right the members denote the sizes of each hidden layer from the input end to the output end, respectively. If the outer layer is twice the size of the inner layer, then the inner layer is copied and concatenated, then a [ResNet architecture](#) is built between them.
- If the option `type_one_side` is set to `true`, the embedding network parameters vary by types of neighbor atoms only, so there will be N_{types} sets of embedding network parameters. Otherwise, the embedding network parameters vary by types of centric atoms and types of neighbor atoms, so there will be N_{types}^2 sets of embedding network parameters.

- The `axis_neuron` specifies the size of the submatrix of the embedding matrix, the axis matrix as explained in the [DeepPot-SE paper](#)
- If the option `resnet_dt` is set to `true`, then a timestep is used in the ResNet.
- `seed` gives the random seed that is used to generate random numbers when initializing the model parameters.

4.3 Descriptor "se_e2_r"

The notation of `se_e2_r` is short for the Deep Potential Smooth Edition (DeepPot-SE) constructed from the radial information of atomic configurations. The `e2` stands for the embedding with two-atom information.

A complete training input script of this example can be found in the directory

```
$deepmd_source_dir/examples/water/se_e2_r/input.json
```

The training input script is very similar to that of `se_e2_a`. The only difference lies in the `descriptor` section

```
"descriptor": {
  "type":          "se_e2_r",
  "sel":           [46, 92],
  "rcut_smth":     0.50,
  "rcut":          6.00,
  "neuron":        [5, 10, 20],
  "resnet_dt":     false,
  "seed":          1,
  "_comment": " that's all"
},
```

The type of the descriptor is set by the key `type`.

4.4 Descriptor "se_e3"

The notation of `se_e3` is short for the Deep Potential Smooth Edition (DeepPot-SE) constructed from all information (both angular and radial) of atomic configurations. The embedding takes angles between two neighboring atoms as input (denoted by `e3`).

A complete training input script of this example can be found in the directory

```
$deepmd_source_dir/examples/water/se_e3/input.json
```

The training input script is very similar to that of `se_e2_a`. The only difference lies in the `descriptor` <model/descriptor> section

```
"descriptor": {
  "type":          "se_e3",
  "sel":           [40, 80],
  "rcut_smth":     0.50,
  "rcut":          6.00,
  "neuron":        [2, 4, 8],
  "resnet_dt":     false,
  "seed":          1,
```

(continues on next page)

(continued from previous page)

```

    "_comment":          " that's all"
  },

```

The type of the descriptor is set by the key `type`.

4.5 Descriptor "se_atten"

4.5.1 DPA-1: Pretraining of Attention-based Deep Potential Model for Molecular Simulation

Here we propose DPA-1, a Deep Potential model with a novel attention mechanism, which is highly effective for representing the conformation and chemical spaces of atomic systems and learning the PES.

See [this paper](#) for more information. DPA-1 is implemented as a new descriptor "se_atten" for model training, which can be used after simply editing the input.json.

4.5.2 Installation

Follow the [standard installation](#) of Python interface in the DeePMD-kit. After that, you can smoothly use the DPA-1 model with the following instructions.

4.5.3 Introduction to new features of DPA-1

Next, we will list the detailed settings in input.json and the data format, especially for large systems with dozens of elements. An example of DPA-1 input can be found [here](#).

Descriptor "se_atten"

The notation of `se_atten` is short for the smooth edition of Deep Potential with an attention mechanism. This descriptor was described in detail in [the DPA-1 paper](#) and the images above.

In this example, we will train a DPA-1 model for a water system. A complete training input script of this example can be found in the directory:

```
$deepmd_source_dir/examples/water/se_atten/input.json
```

With the training input script, data are also provided in the example directory. One may train the model with the DeePMD-kit from the directory.

An example of the DPA-1 descriptor is provided as follows

```
"descriptor" :{
  "type":      "se_atten",
  "rcut_smth": 0.50,
  "rcut":      6.00,
  "sel":       120,
  "neuron":    [25, 50, 100],
  "axis_neuron": 16,
  "resnet_dt": false,
  "attn":      128,
  "attn_layer": 2,
  "attn_mask": false,
  "attn_dotr": true,
  "seed":      1
}
```

- The `type` of the descriptor is set to `"se_atten"`, which will use DPA-1 structures.
- `rcut` is the cut-off radius for neighbor searching, and the `rcut_smth` gives where the smoothing starts.
- `sel` gives the maximum possible number of neighbors in the cut-off radius. It is an int. Note that this number highly affects the efficiency of training, which we usually use less than 200. (We use 120 for training 56 elements in [OC2M dataset](#))
- The `neuron` specifies the size of the embedding net. From left to right the members denote the sizes of each hidden layer from the input end to the output end, respectively. If the outer layer is twice the size of the inner layer, then the inner layer is copied and concatenated, then a [ResNet architecture](#) is built between them.
- The `axis_neuron` specifies the size of the submatrix of the embedding matrix, the axis matrix as explained in the [DeepPot-SE paper](#)
- If the option `resnet_dt` is set to `true`, then a timestep is used in the ResNet.
- `seed` gives the random seed that is used to generate random numbers when initializing the model parameters.
- `attn` sets the length of a hidden vector during scale-dot attention computation.
- `attn_layer` sets the number of layers in attention mechanism.
- `attn_mask` determines whether to mask the diagonal in the attention weights and False is recommended.
- `attn_dotr` determines whether to dot the relative coordinates on the attention weights as a gated scheme, True is recommended.

Fitting "ener"

DPA-1 only supports "ener" fitting type, and you can refer [here](#) for detailed information.

Type embedding

DPA-1 only supports models with type embeddings. And the default setting is as follows:

```
"type_embedding":{
  "neuron":      [8],
  "resnet_dt":    false,
  "seed":         1
}
```

You can add these settings in input.json if you want to change the default ones, see [here](#) for detailed information.

Type map

For training large systems, especially those with dozens of elements, the `type` determines the element index of training data:

```
"type_map": [
  "Mg",
  "Al",
  "Cu"
]
```

which should include all the elements in the dataset you want to train on.

4.5.4 Data format

DPA-1 supports the standard data format, which is detailed in [data-conv.md](#) and [system.md](#). Note that in this format, only those frames with the same fingerprint (i.e. the number of atoms of different elements) can be put together as a unified system. This may lead to sparse frame numbers in those rare systems.

An ideal way is to put systems with the same total number of atoms together, which is the way we trained DPA-1 on [OC2M](#). This system format, which is called `mixed_type`, is proper to put frame-sparse systems together and is slightly different from the standard one. Take an example, a `mixed_type` may contain the following files:

```
type.raw
type_map.raw
set.*/box.npy
set.*/coord.npy
set.*/energy.npy
set.*/force.npy
set.*/real_atom_types.npy
```

This system contains `Nframes` frames with the same atom number `Natoms`, the total number of element types contained in all frames is `Ntypes`. Most files are the same as those in [standard formats](#), here we only list the distinct ones:

ID	Property	File	Re- quired/O	Shape	Description
/	Atom type indexes (place holder)	type.raw	Re- quired	Natoms	All zeros to fake the type input
type_	Atom names	type_map	Re- quired	Ntypes	Atom names that map to atom type contained in all the frames, which is unnecessary to be contained in the periodic table
type	Atom indexes of each frame	real_atom	Re- quired	Nframes * Natoms	Integers that describe atom types in each frame, corresponding to indexes in type_map. -1 means virtual atoms.

With these edited files, one can put together frames with the same `Natoms`, instead of the same formula (like H2O). Note that this `mixed_type` format only supports `se_atten` descriptor.

To put frames with different `Natoms` into the same system, one can pad systems by adding virtual atoms whose type is -1. Virtual atoms do not contribute to any fitting property, so the atomic property of virtual atoms (e.g. forces) should be given zero.

The API to generate or transfer to `mixed_type` format is available on [dpdata](#) for a more convenient experience.

4.5.5 Training example

Here we upload the AlMgCu example shown in the paper, you can download it here: [Baidu disk](#); [Google disk](#).

4.6 Descriptor "hybrid"

This descriptor hybridizes multiple descriptors to form a new descriptor. For example, we have a list of descriptors denoted by $\mathcal{D}_1, \mathcal{D}_2, \dots, \mathcal{D}_N$, the hybrid descriptor is the concatenation of the list, i.e. $\mathcal{D} = (\mathcal{D}_1, \mathcal{D}_2, \dots, \mathcal{D}_N)$.

To use the descriptor in DeePMD-kit, one firstly set the `type` to `hybrid`, then provide the definitions of the descriptors by the items in the `list`,

```
"descriptor" :{
  "type": "hybrid",
  "list" : [
    {
      "type" : "se_e2_a",
      ...
    },
    {
      "type" : "se_e2_r",
      ...
    }
  ]
},
```

A complete training input script of this example can be found in the directory

```
$deepmd_source_dir/examples/water/hybrid/input.json
```

4.7 Determine sel

All descriptors require to set `sel`, which means the expected maximum number of type-*i* neighbors of an atom. DeePMD-kit will allocate memory according to `sel`.

`sel` should not be too large or too small. If `sel` is too large, the computing will become much slower and cost more memory. If `sel` is not enough, the energy will be not conserved, making the accuracy of the model worse.

To determine a proper `sel`, one can calculate the neighbor stat of the training data before training:

```
dp neighbor-stat -s data -r 6.0 -t 0 H
```

where `data` is the directory of data, `6.0` is the cutoff radius, and `0` and `H` is the type map. The program will give the `max_nbor_size`. For example, `max_nbor_size` of the water example is `[38, 72]`, meaning an atom may have 38 O neighbors and 72 H neighbors in the training data.

The `sel` should be set to a higher value than that of the training data, considering there may be some extreme geometries during MD simulations. As a result, we set `sel` to `[46, 92]` in the water example.

4.8 Fit energy

In this section, we will take `$deepmd_source_dir/examples/water/se_e2_a/input.json` as an example of the input file.

4.8.1 The fitting network

The construction of the fitting net is given by section [fitting_net](#)

```
"fitting_net" : {
  "neuron":           [240, 240, 240],
  "resnet_dt":        true,
  "seed":             1
},
```

- `neuron` specifies the size of the fitting net. If two neighboring layers are of the same size, then a [ResNet architecture](#) is built between them.
- If the option `resnet_dt` is set to `true`, then a timestep is used in the ResNet.
- `seed` gives the random seed that is used to generate random numbers when initializing the model parameters.

4.8.2 Loss

The loss function L for training energy is given by

$$L = p_e L_e + p_f L_f + p_v L_v$$

where L_e , L_f , and L_v denote the loss in energy, forces and virials, respectively. p_e , p_f , and p_v give the prefactors of the energy, force and virial losses. The prefactors may not be a constant, rather it changes linearly with the learning rate. Taking the force prefactor for example, at training step t , it is given by

$$p_f(t) = p_f^0 \frac{\alpha(t)}{\alpha(0)} + p_f^\infty (1 - \frac{\alpha(t)}{\alpha(0)})$$

where $\alpha(t)$ denotes the learning rate at step t . p_f^0 and p_f^∞ specifies the p_f at the start of the training and the limit of $t \rightarrow \infty$ (set by `start_pref_f` and `limit_pref_f`, respectively), i.e.

```
pref_f(t) = start_pref_f * ( lr(t) / start_lr ) + limit_pref_f * ( 1 - lr(t) / start_lr )
```

The `loss` section in the `input.json` is

```
{
  "loss" : {
    "start_pref_e": 0.02,
    "limit_pref_e": 1,
    "start_pref_f": 1000,
    "limit_pref_f": 1,
    "start_pref_v": 0,
    "limit_pref_v": 0
  }
}
```

The options `start_pref_e`, `limit_pref_e`, `start_pref_f`, `limit_pref_f`, `start_pref_v` and `limit_pref_v` determine the start and limit prefactors of energy, force and virial, respectively.

If one does not want to train with virial, then he/she may set the virial prefactors `start_pref_v` and `limit_pref_v` to 0.

4.9 Fit tensor like Dipole and Polarizability

Unlike `energy`, which is a scalar, one may want to fit some high dimensional physical quantity, like `dipole` (vector) and `polarizability` (matrix, shorted as `polar`). Deep Potential has provided different APIs to do this. In this example, we will show you how to train a model to fit a water system. A complete training input script of the examples can be found in

```
$deepmd_source_dir/examples/water_tensor/dipole/dipole_input.json
$deepmd_source_dir/examples/water_tensor/polar/polar_input.json
```

The training and validation data are also provided our examples. But note that the data provided along with the examples are of limited amount, and should not be used to train a production model.

Similar to the `input.json` used in `ener` mode, training JSON is also divided into `model`, `learning_rate`, `loss` and `training`. Most keywords remain the same as `ener` mode, and their meaning can be found [here](#). To fit a tensor, one needs to modify `model/fitting_net` and `loss`.

4.9.1 The fitting Network

The `fitting_net` section tells DP which fitting net to use.

The JSON of `dipole` type should be provided like

```
"fitting_net" : {
  "type": "dipole",
  "sel_type": [0],
  "neuron": [100,100,100],
  "resnet_dt": true,
  "seed": 1,
},
```

The JSON of `polar` type should be provided like

```
"fitting_net" : {
  "type": "polar",
  "sel_type": [0],
  "neuron": [100,100,100],
  "resnet_dt": true,
  "seed": 1,
},
```

- `type` specifies which type of fitting net should be used. It should be either `dipole` or `polar`. Note that `global_polar` mode in version 1.x is already deprecated and is merged into `polar`. To specify whether a system is global or atomic, please see [here](#).
- `sel_type` is a list specifying which type of atoms have the quantity you want to fit. For example, in the water system, `sel_type` is `[0]` since 0 represents atom O. If left unset, all types of atoms will be fitted.
- The rest arguments have the same meaning as they do in `ener` mode.

4.9.2 Loss

DP supports a combinational training of the global system (only a global `tensor` label, i.e. `dipole` or `polar`, is provided in a frame) and atomic system (labels for each atom included in `sel_type` are provided). In a global system, each frame has just one `tensor` label. For example, when fitting `polar`, each frame will just provide a `1 x 9` vector which gives the elements of the polarizability tensor of that frame in order `XX, XY, XZ, YX, YY, YZ, XZ, ZY, ZZ`. By contrast, in an atomic system, each atom in `sel_type` has a `tensor` label. For example, when fitting a `dipole`, each frame will provide a `#sel_atom x 3` matrices, where `#sel_atom` is the number of atoms whose type are in `sel_type`.

The `loss` section tells DP the weight of these two kinds of loss, i.e.

```
loss = pref * global_loss + pref_atomic * atomic_loss
```

The loss section should be provided like

```
"loss" : {
  "type": "tensor",
  "pref": 1.0,
  "pref_atomic": 1.0
},
```

- `type` should be written as `tensor` as a distinction from `ener` mode.

- `pref` and `pref_atomic` respectively specify the weight of global loss and atomic loss. It can not be left unset. If set to 0, the corresponding label will NOT be included in the training process.

4.9.3 Training Data Preparation

In tensor mode, the identification of the label's type (global or atomic) is derived from the file name. The global label should be named `dipole.npy/raw` or `polarizability.npy/raw`, while the atomic label should be named `atomic_dipole.npy/raw` or `atomic_polarizability.npy/raw`. If wrongly named, DP will report an error

```
ValueError: cannot reshape array of size xxx into shape (xx,xx). This error may occur when your
↪ label mismatch it's name, i.e. you might store global tensor in `atomic_tensor.npy` or atomic
↪ tensor in `tensor.npy`.
```

In this case, please check the file name of the label.

4.9.4 Train the Model

The training command is the same as `ener` mode, i.e.

```
dp train input.json
```

The detailed loss can be found in `lcurve.out`:

#	step	rmse_val	rmse_trn	rmse_lc_val	rmse_lc_trn	rmse_gl_val	rmse_gl_trn	lr
	0	8.34e+00	8.26e+00	8.34e+00	8.26e+00	0.00e+00	0.00e+00	1.0e-02

	1400	3.13e-02	5.76e-02	3.13e-02	5.76e-02	0.00e+00	0.00e+00	6.3e-07
	1500	3.34e-02	1.11e-02	2.09e-02	0.00e+00	1.57e-03	1.39e-03	3.2e-07
	1600	3.11e-02	5.64e-02	3.11e-02	5.64e-02	0.00e+00	0.00e+00	1.6e-07
	1700	2.97e-02	5.05e-02	2.97e-02	5.05e-02	0.00e+00	0.00e+00	7.9e-08
	1800	2.64e-02	7.70e-02	1.09e-02	0.00e+00	1.94e-03	9.62e-03	4.0e-08
	1900	3.28e-02	2.56e-02	3.28e-02	0.00e+00	0.00e+00	3.20e-03	2.0e-08
	2000	2.59e-02	5.71e-02	1.03e-02	5.71e-02	1.94e-03	0.00e+00	1.0e-08

One may notice that in each step, some of the local loss and global loss will be 0.0. This is because our training data and validation data consist of the global system and atomic system, i.e.

```
--training_data
>atomic_system
>global_system
--validation_data
```

(continues on next page)

(continued from previous page)

```
>atomic_system
>global_system
```

During training, at each step when the `lcurve.out` is printed, the system used for evaluating the training (validation) error may be either with only global or only atomic labels, thus the corresponding atomic or global errors are missing and are printed as zeros.

4.10 Type embedding approach

We generate specific a type embedding vector for each atom type so that we can share one descriptor embedding net and one fitting net in total, which decline training complexity largely.

The training input script is similar to that of `se_e2_a`, but different by adding the `type_embedding` section.

4.10.1 Type embedding net

The `model` defines how the model is constructed, adding a section of type embedding net:

```
"model": {
  "type_map":      ["O", "H"],
  "type_embedding":{
    ...
  },
  "descriptor" :{
    ...
  },
  "fitting_net" : {
    ...
  }
}
```

The model will automatically apply the type embedding approach and generate type embedding vectors. If the type embedding vector is detected, the descriptor and fitting net would take it as a part of the input.

The construction of type embedding net is given by `type_embedding`. An example of `type_embedding` is provided as follows

```
"type_embedding":{
  "neuron":      [2, 4, 8],
  "resnet_dt":   false,
  "seed":        1
}
```

- The `neuron` specifies the size of the type embedding net. From left to right the members denote the sizes of each hidden layer from the input end to the output end, respectively. It takes a one-hot vector as input and output dimension equals to the last dimension of the `neuron` list. If the outer layer is twice the size of the inner layer, then the inner layer is copied and concatenated, then a ResNet architecture is built between them.
- If the option `resnet_dt` is set to `true`, then a timestep is used in the ResNet.
- `seed` gives the random seed that is used to generate random numbers when initializing the model parameters.

A complete training input script of this example can be found in the directory.

```
$deepmd_source_dir/examples/water/se_e2_a_tebd/input.json
```

See [here](#) for further explanation of type embedding.

Note: You can't apply the compression method while using the atom type embedding.

4.11 Descriptor "se_a_mask"

Descriptor `se_a_mask` is a concise implementation of the descriptor `se_e2_a`, but functions slightly differently. `se_a_mask` is specially designed for DP/MM simulations where the number of atoms in DP regions is dynamically changed in simulations.

Therefore, the descriptor `se_a_mask` is not supported for training with PBC systems for simplicity. Besides, to make the output shape of the descriptor matrix consistent, the input coordinates are padded with virtual particle coordinates to the maximum number of atoms (specified with `sel` in the descriptor setting) in the system. The real/virtual sign of the atoms is specified with the `aparam.npy` (`[nframes * natoms]`) file in the input systems set directory. The `aparam.npy` can also be seen as the mask of the atoms in the system, which is also the origin of the name `se_a_mask`.

In this example, we will train a DP Mask model for zinc protein interactions. The input systems are the collection of zinc and its coordinates residues. A sample input system that contains 2 frames is included in the directory.

```
$deepmd_source_dir/examples/zinc_protein/data_dp_mask
```

A complete training input script of this example can be found in the directory.

```
$deepmd_source_dir/examples/zinc_protein/zinc_se_a_mask.json
```

The construction of the descriptor is given by section [descriptor](#). An example of the descriptor is provided as follows

```
"descriptor" :{
  "type":      "se_a_mask",
  "sel":      [36, 16, 24, 64, 6, 1],
  "neuron":   [25, 50, 100],
    "axis_neuron": 16,
  "type_one_side": false,
  "resnet_dt": false,
  "seed":     1
}
```

- The `type` of the descriptor is set to `"se_a_mask"`.
- `sel` gives the maximum number of atoms in input coordinates. It is a list, the length of which is the same as the number of atom types in the system, and `sel[i]` denotes the maximum number of atoms with type `i`.
- The `neuron` specifies the size of the embedding net. From left to right the members denote the sizes of each hidden layer from the input end to the output end, respectively. If the outer layer is twice the size of the inner layer, then the inner layer is copied and concatenated, then a [ResNet architecture](#) is built between them.

- The `axis_neuron` specifies the size of the submatrix of the embedding matrix, the axis matrix as explained in the [DeepPot-SE paper](#)
- If the option `type_one_side` is set to `true`, the embedding network parameters vary by types of neighbor atoms only, so there will be N_{types} sets of embedding network parameters. Otherwise, the embedding network parameters vary by types of centric atoms and types of neighbor atoms, so there will be N_{types}^2 sets of embedding network parameters.
- If the option `resnet_dt` is set to `true`, then a timestep is used in the ResNet.
- `seed` gives the random seed that is used to generate random numbers when initializing the model parameters.

To make the `aparam.npy` used for descriptor `se_a_mask`, two variables in `fitting_net` section are needed.

```
"fitting_net" :{
  "neuron": [240, 240, 240],
  "resnet_dt": true,
  "seed": 1,
  "numb_aparam": 1,
  "use_aparam_as_mask": true
}
```

- `neuron`, `resnet_dt` and `seed` are the same as the `fitting_net` section for fitting energy.
- `numb_aparam` gives the dimension of the `aparam.npy` file. In this example, it is set to 1 and stores the real/virtual sign of the atoms. For real/virtual atoms, the corresponding sign in `aparam.npy` is set to 1/0.
- `use_aparam_as_mask` is set to `true` to use the `aparam.npy` as the mask of the atoms in the descriptor `se_a_mask`.

Finally, to make a reasonable fitting task with `se_a_mask` descriptor for DP/MM simulations, the loss function with `se_a_mask` is designed to include the atomic forces difference in specific atoms of the input particles only. More details about the selection of the specific atoms can be found in paper [DP/MM](left to be filled). Thus, `atom_pref.npy` (`[nframes * natoms]`) is required as the indicator of the specific atoms in the input particles. And the `loss` section in the training input script should be set as follows.

```
"loss": {
  "type": "ener",
  "start_pref_e": 0.0,
  "limit_pref_e": 0.0,
  "start_pref_f": 0.0,
  "limit_pref_f": 0.0,
  "start_pref_pf": 1.0,
  "limit_pref_pf": 1.0,
  "_comment": " that's all"
}
```

4.12 Deep potential long-range (DPLR)

Notice: The interfaces of DPLR are not stable and subject to change

The method of DPLR is described in [this paper](#). One is recommended to read the paper before using the DPLR.

In the following, we take the DPLR model for example to introduce the training and LAMMPS simulation with the DPLR model. The DPLR model is trained in two steps.

4.12.1 Train a deep Wannier model for Wannier centroids

We use the deep Wannier model (DW) to represent the relative position of the Wannier centroid (WC) with the atom with which it is associated. One may consult the introduction of the [dipole model](#) for a detailed introduction. An example input `wc.json` and a small dataset `data` for tutorial purposes can be found in

```
$deepmd_source_dir/examples/water/dplr/train/
```

It is noted that the tutorial dataset is not enough for training a productive model. Two settings make the training input script different from an energy training input:

```
"fitting_net": {
  "type":          "dipole",
  "dipole_type":   [0],
  "neuron":        [128, 128, 128],
  "seed":          1
},
```

The type of fitting is set to [dipole](#). The dipole is associated with type 0 atoms (oxygen), by the setting `"dipole_type": [0]`. What we trained is the displacement of the WC from the corresponding oxygen atom. It shares the same training input as the atomic dipole because both are 3-dimensional vectors defined on atoms. The loss section is provided as follows

```
"loss": {
  "type":          "tensor",
  "pref":          0.0,
  "pref_atomic":   1.0
},
```

so that the atomic dipole is trained as labels. Note that the NumPy compressed file `atomic_dipole.npy` should be provided in each dataset.

The training and freezing can be started from the example directory by

```
dp train dw.json && dp freeze -o dw.pb
```

4.12.2 Train the DPLR model

The training of the DPLR model is very similar to the standard short-range DP models. An example input script can be found in the example directory. The following section is introduced to compute the long-range energy contribution of the DPLR model, and modify the short-range DP model by this part.

```
"modifier": {
  "type":          "dipole_charge",
  "model_name":    "dw.pb",
  "model_charge_map": [-8],
  "sys_charge_map": [6, 1],
  "ewald_h":       1.00,
  "ewald_beta":    0.40
},
```

The `model_name` specifies which DW model is used to predict the position of WCs. `model_charge_map` gives the amount of charge assigned to WCs. `sys_charge_map` provides the nuclear charge of oxygen (type 0) and hydrogen (type 1) atoms. `ewald_beta` (unit \AA^{-1}) gives the spread parameter controls the spread of Gaussian charges, and `ewald_h` (unit \AA) assigns the grid size of Fourier transformation. The DPLR model can be trained and frozen by (from the example directory)

```
dp train ener.json && dp freeze -o ener.pb
```

4.12.3 Molecular dynamics simulation with DPLR

In MD simulations, the long-range part of the DPLR is calculated by the LAMMPS `kspace` support. Then the long-range interaction is back-propagated to atoms by DeePMD-kit. This setup is commonly used in classical molecular dynamics simulations as the “virtual site”. Unfortunately, LAMMPS does not natively support virtual sites, so we have to hack the LAMMPS code, which makes the input configuration and script a little wired.

An example of an input configuration file and script can be found in

```
$deepmd_source_dir/examples/water/dplr/lmp/
```

We use `atom_style full` for DPLR simulations. the coordinates of the WCs are explicitly written in the configuration file. Moreover, a virtual bond is established between the oxygens and the WCs to indicate they are associated together. The configuration file containing 128 H₂O molecules is thus written as

```
512 atoms
3 atom types
128 bonds
1 bond types

0 16.421037674 xlo xhi
0 16.421037674 ylo yhi
0 16.421037674 zlo zhi
0 0 0 xy xz yz

Masses

1 16
2 2
3 16
```

(continues on next page)

(continued from previous page)

Atoms

```

      1      1 1 6 8.4960699081e+00 7.5073699951e+00 9.6371297836e+00
      2      2 1 6 4.0597701073e+00 6.8156299591e+00 1.2051420212e+01
...
    385      1 3 -8 8.4960699081e+00 7.5073699951e+00 9.6371297836e+00
    386      2 3 -8 4.0597701073e+00 6.8156299591e+00 1.2051420212e+01
...

```

Bonds

```

1 1 1 385
2 1 2 386
...

```

The oxygens and hydrogens are assigned with atom types 1 and 2 (corresponding to training atom types 0 and 1), respectively. The WCs are assigned with atom type 3. We want to simulate heavy water so the mass of hydrogens is set to 2.

An example input script is provided in

```
$deepmd_source_dir/examples/water/dplr/lmp/in.lammps
```

Here are some explanations

```

# groups of real and virtual atoms
group          real_atom type 1 2
group          virtual_atom type 3

# bond between real and its corresponding virtual site should be given
# to setup a map between real and virtual atoms. However, no real
# bonded interaction is applied, thus bond_style "zero" is used.
pair_style      deepmd ener.pb
pair_coeff      * *
bond_style      zero
bond_coeff      *
special_bonds   lj/coul 1 1 1 angle no

```

Type 1 and 2 (O and H) are `real_atoms`, while type 3 (WCs) are `virtual_atoms`. The model file `ener.pb` stores both the DW and DPLR models, so the position of WCs and the energy can be inferred from it. A virtual bond type is specified by `bond_style zero`. The `special_bonds` command switches off the exclusion of intramolecular interactions.

```

# kspace_style "pppm/dplr" should be used. in addition the
# gewald(1/distance) should be set the same as that used in
# training. Currently only ik differentiation is supported.
kspace_style    pppm/dplr 1e-5
kspace_modify   gewald ${BETA} diff ik mesh ${KMESH} ${KMESH} ${KMESH}

```

The long-range part is calculated by the `kspace` support of LAMMPS. The `kspace_style pppm/dplr` is required. The spread parameter set by variable `BETA` should be set the same as that used in training. The `KMESH` should be set dense enough so the long-range calculation is converged.

```
# "fix dplr" set the position of the virtual atom, and spread the
# electrostatic interaction asserting on the virtual atom to the real
# atoms. "type_associate" associates the real atom type its
# corresponding virtual atom type. "bond_type" gives the type of the
# bond between the real and virtual atoms.
fix                0 all dplr model ener.pb type_associate 1 3 bond_type 1
fix_modify         0 virial yes
```

The fix command `dplr` calculates the position of WCs by the DW model and back-propagates the long-range interaction on virtual atoms to real atoms. At this time, the training parameter `type_map` will be mapped to LAMMPS atom types.

```
# compute the temperature of real atoms, excluding virtual atom contribution
compute            real_temp real_atom temp
compute            real_press all pressure real_temp
fix                1 real_atom nvt temp ${TEMP} ${TEMP} ${TAU_T}
fix_modify         1 temp real_temp
```

The temperature of the system should be computed from the real atoms. The kinetic contribution in the pressure tensor is also computed from the real atoms. The thermostat is applied to only real atoms. The computed temperature and pressure of real atoms can be accessed by, e.g.

```
fix                thermo_print all print ${THERMO_FREQ} "$(step) $(pe) $(ke) $(etotal) $(enthalpy)
↪$(c_real_temp) $(c_real_press) $(vol) $(c_real_press[1]) $(c_real_press[2]) $(c_real_press[3])"
↪append thermo.out screen no title "# step pe ke etotal enthalpy temp press vol pxx pyy pzz"
```

The LAMMPS simulation can be started from the example directory by

```
lmp -i in.lammps
```

If LAMMPS complains that no model file `ener.pb` exists, it can be copied from the training example directory.

The MD simulation lasts for only 20 steps. If one runs a longer simulation, it will blow up, because the model is trained with a very limited dataset for very short training steps, thus is of poor quality.

Another restriction that should be noted is that the energies printed at the zero steps are not correct. This is because at the zero steps the position of the WC has not been updated with the DW model. The energies printed in later steps are correct.

4.13 Deep Potential - Range Correction (DPRc)

Deep Potential - Range Correction (DPRc) is designed to combine with QM/MM method, and corrects energies from a low-level QM/MM method to a high-level QM/MM method:

$$E = E_{\text{QM}}(\mathbf{R}; \mathbf{P}) + E_{\text{QM/MM}}(\mathbf{R}; \mathbf{P}) + E_{\text{MM}}(\mathbf{R}) + E_{\text{DPRc}}(\mathbf{R})$$

See the [JCTC](#) paper for details.

4.13.1 Training data

Instead the normal ab initio data, one needs to provide the correction from a low-level QM/MM method to a high-level QM/MM method:

$$E = E_{\text{high-level QM/MM}} - E_{\text{low-level QM/MM}}$$

Two levels of data use the same MM method, so E_{MM} is eliminated.

4.13.2 Training the DPRc model

In a DPRc model, QM atoms and MM atoms have different atom types. Assuming we have 4 QM atom types (C, H, O, P) and 2 MM atom types (HW, OW):

```
"type_map": ["C", "H", "HW", "O", "OW", "P"]
```

As described in the paper, the DPRc model only corrects E_{QM} and $E_{\text{QM/MM}}$ within the cutoff, so we use a hybrid descriptor to describe them separately:

```
"descriptor" :{
  "type":      "hybrid",
  "list" : [
    {
      "type":    "se_e2_a",
      "sel":     [6, 11, 0, 6, 0, 1],
      "rcut_smth": 1.00,
      "rcut":     9.00,
      "neuron":   [12, 25, 50],
      "exclude_types": [[2, 2], [2, 4], [4, 4], [0, 2], [0, 4], [1, 2], [1, 4], [3, 2],
↪ [3, 4], [5, 2], [5, 4]],
      "axis_neuron": 12,
      "set_davg_zero": true,
      "_comment": " QM/QM interaction"
    },
    {
      "type":    "se_e2_a",
      "sel":     [6, 11, 100, 6, 50, 1],
      "rcut_smth": 0.50,
      "rcut":     6.00,
      "neuron":   [12, 25, 50],
      "exclude_types": [[0, 0], [0, 1], [0, 3], [0, 5], [1, 1], [1, 3], [1, 5], [3, 3],
↪ [3, 5], [5, 5], [2, 2], [2, 4], [4, 4]],
      "axis_neuron": 12,
      "set_davg_zero": true,
      "_comment": " QM/MM interaction"
    }
  ]
}
```

`exclude_types` can be generated by the following Python script:

```
from itertools import combinations_with_replacement, product
qm = (0, 1, 3, 5)
mm = (2, 4)
print("QM/QM:", list(map(list, list(combinations_with_replacement(mm, 2)) + list(product(qm,
↪ mm))))))
```

(continues on next page)

(continued from previous page)

```
print("QM/MM:", list(map(list, list(combinations_with_replacement(qm, 2)) + list(combinations_with_
↪ replacement(mm, 2)))))
```

Also, DPRc assumes MM atom energies (`atom_ener`) are zero:

```
"fitting_net": {
  "neuron": [240, 240, 240],
  "resnet_dt": true,
  "atom_ener": [null, null, 0.0, null, 0.0, null]
}
```

Note that `atom_ener` only works when `descriptor/set_davg_zero` is `true`.

4.13.3 Run MD simulations

The DPRc model has the best practices with the [AMBER](#) QM/MM module. An example is given by [GitLab RutgersLBSR/AmberDPRc](#). In theory, DPRc is able to be used with any QM/MM package, as long as the DeePMD-kit package accepts QM atoms and MM atoms within the cutoff range and returns energies and forces.

TRAINING

5.1 Train a model

Several examples of training can be found in the `examples` directory:

```
$ cd $deepmd_source_dir/examples/water/se_e2_a/
```

After switching to that directory, the training can be invoked by

```
$ dp train input.json
```

where `input.json` is the name of the input script.

By default, the verbosity level of the DeePMD-kit is `INFO`, one may see a lot of important information on the code and environment showing on the screen. Among them two pieces of information regarding data systems are worth special notice.

```
DEEPMD INFO    ---Summary of DataSystem: training  -----
↪--
DEEPMD INFO    found 3 system(s):
DEEPMD INFO
DEEPMD INFO          system  natoms  bch_sz  n_bch  prob  pbc
DEEPMD INFO    ../data_water/data_0/    192    1    80  0.250  T
DEEPMD INFO    ../data_water/data_1/    192    1   160  0.500  T
DEEPMD INFO    ../data_water/data_2/    192    1    80  0.250  T
DEEPMD INFO    -----
↪--
DEEPMD INFO    ---Summary of DataSystem: validation  -----
↪--
DEEPMD INFO    found 1 system(s):
DEEPMD INFO
DEEPMD INFO          system  natoms  bch_sz  n_bch  prob  pbc
DEEPMD INFO    ../data_water/data_3    192    1    80  1.000  T
DEEPMD INFO    -----
↪--
```

The DeePMD-kit prints detailed information on the training and validation data sets. The data sets are defined by `training_data` and `validation_data` defined in the `training` section of the input script. The training data set is composed of three data systems, while the validation data set is composed by one data system. The number of atoms, batch size, the number of batches in the system and the probability of using the system are all shown on the screen. The last column presents if the periodic boundary condition is assumed for the system.

During the training, the error of the model is tested every `disp_freq` training steps with the batch used to train the model and with `numb_btch` batches from the validating data. The training error and validation error are printed correspondingly in the file `disp_file` (default is `1curve.out`). The batch size can be set in the

input script by the key `batch_size` in the corresponding sections for the training and validation data set. An example of the output

#	step	rmse_val	rmse_trn	rmse_e_val	rmse_e_trn	rmse_f_val	rmse_f_trn	lr
	0	3.33e+01	3.41e+01	1.03e+01	1.03e+01	8.39e-01	8.72e-01	1.0e-03
	100	2.57e+01	2.56e+01	1.87e+00	1.88e+00	8.03e-01	8.02e-01	1.0e-03
	200	2.45e+01	2.56e+01	2.26e-01	2.21e-01	7.73e-01	8.10e-01	1.0e-03
	300	1.62e+01	1.66e+01	5.01e-02	4.46e-02	5.11e-01	5.26e-01	1.0e-03
	400	1.36e+01	1.32e+01	1.07e-02	2.07e-03	4.29e-01	4.19e-01	1.0e-03
	500	1.07e+01	1.05e+01	2.45e-03	4.11e-03	3.38e-01	3.31e-01	1.0e-03

The file contains 8 columns, from left to right, which are the training step, the validation loss, training loss, root mean square (RMS) validation error of energy, RMS training error of energy, RMS validation error of force, RMS training error of force and the learning rate. The RMS error (RMSE) of the energy is normalized by the number of atoms in the system. One can visualize this file with a simple Python script:

```
import numpy as np
import matplotlib.pyplot as plt

data = np.genfromtxt("lcurve.out", names=True)
for name in data.dtype.names[1:-1]:
    plt.plot(data['step'], data[name], label=name)
plt.legend()
plt.xlabel('Step')
plt.ylabel('Loss')
plt.xscale('symlog')
plt.yscale('log')
plt.grid()
plt.show()
```

Checkpoints will be written to files with the prefix `save_ckpt` every `save_freq` training steps.

Warning: It is warned that the example water data (in folder `examples/water/data`) is of very limited amount, is provided only for testing purposes, and should not be used to train a production model.

5.2 Advanced options

In this section, we will take `$deepmd_source_dir/examples/water/se_e2_a/input.json` as an example of the input file.

5.2.1 Learning rate

The `learning_rate` section in `input.json` is given as follows

```
{
  "learning_rate" : {
    "type": "exp",
    "start_lr": 0.001,
    "stop_lr": 3.51e-8,
    "decay_steps": 5000,
    "_comment": "that's all"
  }
}
```

- `start_lr` gives the learning rate at the beginning of the training.
- `stop_lr` gives the learning rate at the end of the training. It should be small enough to ensure that the network parameters satisfactorily converge.
- During the training, the learning rate decays exponentially from `start_lr` to `stop_lr` following the formula:

$$\alpha(t) = \alpha_0 \lambda^{t/\tau}$$

where t is the training step, α is the learning rate, α_0 is the starting learning rate (set by `start_lr`), λ is the decay rate, and τ is the decay steps, i.e.

```
...
lr(t) = start_lr * decay_rate ^ ( t / decay_steps )
...
```

5.2.2 Training parameters

Other training parameters are given in the `training` section.

```
{
  "training": {
    "training_data": {
      "systems": ["../data_water/data_0/", "../data_water/data_1/", "../data_
↪water/data_2/"],
      "batch_size": "auto"
    },
    "validation_data": {
      "systems": ["../data_water/data_3"],
      "batch_size": 1,
      "numb_btch": 3
    },
    "mixed_precision": {
      "output_prec": "float32",
      "compute_prec": "float16"
    },
    "numb_steps": 1000000,
    "seed": 1,
    "disp_file": "lcurve.out",
    "disp_freq": 100,
    "save_freq": 1000
  }
}
```

The sections `training_data` and `validation_data` give the training dataset and validation dataset, respectively. Taking the training dataset for example, the keys are explained below:

- `systems` provide paths of the training data systems. DeePMD-kit allows you to provide multiple systems with different numbers of atoms. This key can be a `list` or a `str`.
 - `list`: `systems` gives the training data systems.
 - `str`: `systems` should be a valid path. DeePMD-kit will recursively search all data systems in this path.
- At each training step, DeePMD-kit randomly picks `batch_size` frame(s) from one of the systems. The probability of using a system is by default in proportion to the number of batches in the system. More options are available for automatically determining the probability of using systems. One can set the key `auto_prob` to

- "prob_uniform" all systems are used with the same probability.
 - "prob_sys_size" the probability of using a system is proportional to its size (number of frames).
 - "prob_sys_size; sidx_0:eidx_0:w_0; sidx_1:eidx_1:w_1;..." the list of systems is divided into blocks. Block *i* has systems ranging from *sidx_i* to *eidx_i*. The probability of using a system from block *i* is proportional to *w_i*. Within one block, the probability of using a system is proportional to its size.
- An example of using "auto_prob" is given below. The probability of using `systems[2]` is 0.4, and the sum of the probabilities of using `systems[0]` and `systems[1]` is 0.6. If the number of frames in `systems[1]` is twice of `system[0]`, then the probability of using `system[1]` is 0.4 and that of `system[0]` is 0.2.

```

"training_data": {
  "systems":          ["../data_water/data_0/", "../data_water/data_1/", "../data_
↪water/data_2/"],
  "auto_prob":        "prob_sys_size; 0:2:0.6; 2:3:0.4",
  "batch_size":        "auto"
}

```

- The probability of using systems can also be specified explicitly with key `sys_probs` which is a list having the length of the number of systems. For example

```

"training_data": {
  "systems":          ["../data_water/data_0/", "../data_water/data_1/", "../data_
↪water/data_2/"],
  "sys_probs":         [0.5, 0.3, 0.2],
  "batch_size":        "auto:32"
}

```

- The key `batch_size` specifies the number of frames used to train or validate the model in a training step. It can be set to
 - `list`: the length of which is the same as the systems. The batch size of each system is given by the elements of the list.
 - `int`: all systems use the same batch size.
 - `"auto"`: the same as `"auto:32"`, see `"auto:N"`
 - `"auto:N"`: automatically determines the batch size so that the `batch_size` times the number of atoms in the system is no less than *N*.
- The key `numb_batch` in `validate_data` gives the number of batches of model validation. Note that the batches may not be from the same system

The section `mixed_precision` specifies the mixed precision settings, which will enable the mixed precision training workflow for DeePMD-kit. The keys are explained below:

- `output_prec` precision used in the output tensors, only `float32` is supported currently.
- `compute_prec` precision used in the computing tensors, only `float16` is supported currently. Note there are several limitations about mixed precision training:
- Only `se_e2_a` type descriptor is supported by the mixed precision training workflow.
- The precision of the embedding net and the fitting net are forced to be set to `float32`.

Other keys in the `training` section are explained below:

- `numb_steps` The number of training steps.

- `seed` The random seed for getting frames from the training data set.
- `disp_file` The file for printing learning curve.
- `disp_freq` The frequency of printing learning curve. Set in the unit of training steps
- `save_freq` The frequency of saving checkpoint.

5.2.3 Options and environment variables

Several command line options can be passed to `dp train`, which can be checked with

```
$ dp train --help
```

An explanation will be provided

```
positional arguments:
  INPUT                the input json database

optional arguments:
  -h, --help            show this help message and exit

  --init-model INIT_MODEL
                        Initialize a model by the provided checkpoint

  --restart RESTART      Restart the training from the provided checkpoint

  --init-frz-model INIT_FRZ_MODEL
                        Initialize the training from the frozen model.

  --skip-neighbor-stat  Skip calculating neighbor statistics. Sel checking, automatic sel, and
  ↪ model compression will be disabled. (default: False)
```

`--init-model model.ckpt`, initializes the model training with an existing model that is stored in the checkpoint `model.ckpt`, the network architectures should match.

`--restart model.ckpt`, continues the training from the checkpoint `model.ckpt`.

`--init-frz-model frozen_model.pb`, initializes the training with an existing model that is stored in `frozen_model.pb`.

`--skip-neighbor-stat` will skip calculating neighbor statistics if one is concerned about performance. Some features will be disabled.

To maximize the performance, one should follow [FAQ: How to control the parallelism of a job](#) to control the number of threads.

One can set other environmental variables:

Environment variables	Allowed value	Default value	Usage
<code>DP_INTERFACE_I</code>	high, low	high	Control high (double) or low (float) precision of training.
<code>DP_AUTO_PARAL</code>	0, 1	0	Enable auto parallelization for CPU operators.
<code>DP_JIT</code>	0, 1	0	Enable JIT. Note that this option may either improve or decrease the performance. Requires TensorFlow supports JIT.

5.2.4 Adjust *sel* of a frozen model

One can use `--init-frz-model` features to adjust (increase or decrease) *sel* of a existing model. Firstly, one needs to adjust *sel* in `input.json`. For example, adjust from `[46, 92]` to `[23, 46]`.

```
"model": {
  "descriptor": {
    "sel": [23, 46]
  }
}
```

To obtain the new model at once, *numb_steps* should be set to zero:

```
"training": {
  "numb_steps": 0
}
```

Then, one can initialize the training from the frozen model and freeze the new model at once:

```
dp train input.json --init-frz-model frozen_model.pb
dp freeze -o frozen_model_adjusted_sel.pb
```

Two models should give the same result when the input satisfies both constraints.

Note: At this time, this feature is only supported by *se_e2_a* descriptor with *set_davg_true* enabled, or hybrid composed of the above descriptors.

5.3 Training Parameters

Note: One can load, modify, and export the input file by using our effective web-based tool [DP-GUI](#). All training parameters below can be set in DP-GUI. By clicking “SAVE JSON”, one can download the input file for further training.

model:

type: dict
argument path: model

type_map:

type: list, optional
argument path: model/type_map

A list of strings. Give the name to each type of atoms. It is noted that the number of atom type of training system must be less than 128 in a GPU environment. If not given, `type.raw` in each system should use the same type indexes, and `type_map.raw` will take no effect.

data_stat_nbatch:

type: int, optional, default: 10
argument path: model/data_stat_nbatch

The model determines the normalization from the statistics of the data. This key specifies the number of frames in each system used for statistics.

data_stat_protect:

type: float, optional, default: 0.01
 argument path: model/data_stat_protect

Protect parameter for atomic energy regression.

data_bias_nsample:

type: int, optional, default: 10
 argument path: model/data_bias_nsample

The number of training samples in a system to compute and change the energy bias.

use_srtab:

type: str, optional
 argument path: model/use_srtab

The table for the short-range pairwise interaction added on top of DP. The table is a text data file with $(N_t + 1) * N_t / 2 + 1$ columns. The first column is the distance between atoms. The second to the last columns are energies for pairs of certain types. For example we have two atom types, 0 and 1. The columns from 2nd to 4th are for 0-0, 0-1 and 1-1 correspondingly.

smin_alpha:

type: float, optional
 argument path: model/smin_alpha

The short-range tabulated interaction will be swithed according to the distance of the nearest neighbor. This distance is calculated by softmin. This parameter is the decaying parameter in the softmin. It is only required when use_srtab is provided.

sw_rmin:

type: float, optional
 argument path: model/sw_rmin

The lower boundary of the interpolation between short-range tabulated interaction and DP. It is only required when use_srtab is provided.

sw_rmax:

type: float, optional
 argument path: model/sw_rmax

The upper boundary of the interpolation between short-range tabulated interaction and DP. It is only required when use_srtab is provided.

type_embedding:

type: dict, optional
 argument path: model/type_embedding

The type embedding.

neuron:

type: list, optional, default: [8]
 argument path: model/type_embedding/neuron

Number of neurons in each hidden layers of the embedding net. When two layers are of the same size or one layer is twice as large as the previous layer, a skip connection is built.

activation_function:

type: str, optional, default: tanh

argument path: model/type_embedding/activation_function

The activation function in the embedding net. Supported activation functions are “relu”, “relu6”, “softplus”, “sigmoid”, “tanh”, “gelu”, “gelu_tf”, “None”, “none”. Note that “gelu” denotes the custom operator version, and “gelu_tf” denotes the TF standard version. If you set “None” or “none” here, no activation function will be used.

resnet_dt:

type: bool, optional, default: False

argument path: model/type_embedding/resnet_dt

Whether to use a “Timestep” in the skip connection

precision:

type: str, optional, default: default

argument path: model/type_embedding/precision

The precision of the embedding net parameters, supported options are “default”, “float16”, “float32”, “float64”, “bfloat16”. Default follows the interface precision.

trainable:

type: bool, optional, default: True

argument path: model/type_embedding/trainable

If the parameters in the embedding net are trainable

seed:

type: NoneType | int, optional, default: None

argument path: model/type_embedding/seed

Random seed for parameter initialization

descriptor:

type: dict

argument path: model/descriptor

The descriptor of atomic environment.

Depending on the value of type, different sub args are accepted.

type:

type: str (flag key)

argument path: model/descriptor/type

possible choices: *loc_frame*, *se_e2_a*, *se_e3*, *se_a_tpe*, *se_e2_r*, *hybrid*, *se_atten*, *se_a_mask*

The type of the descriptor. See explanation below.

- *loc_frame*: Defines a local frame at each atom, and the compute the descriptor as local coordinates under this frame.
- *se_e2_a*: Used by the smooth edition of Deep Potential. The full relative coordinates are used to construct the descriptor.
- *se_e2_r*: Used by the smooth edition of Deep Potential. Only the distance between atoms is used to construct the descriptor.

- `se_e3`: Used by the smooth edition of Deep Potential. The full relative coordinates are used to construct the descriptor. Three-body embedding will be used by this descriptor.
- `se_a_tpe`: Used by the smooth edition of Deep Potential. The full relative coordinates are used to construct the descriptor. Type embedding will be used by this descriptor.
- `se_atten`: Used by the smooth edition of Deep Potential. The full relative coordinates are used to construct the descriptor. Attention mechanism will be used by this descriptor.
- `se_a_mask`: Used by the smooth edition of Deep Potential. It can accept a variable number of atoms in a frame (Non-PBC system). `aparam` are required as an indicator matrix for the real/virtual sign of input atoms.
- `hybrid`: Concatenate of a list of descriptors as a new descriptor.

When `type` is set to `loc_frame`:

`sel_a`:

type: list

argument path: `model/descriptor[loc_frame]/sel_a`

A list of integers. The length of the list should be the same as the number of atom types in the system. `sel_a[i]` gives the selected number of type-*i* neighbors. The full relative coordinates of the neighbors are used by the descriptor.

`sel_r`:

type: list

argument path: `model/descriptor[loc_frame]/sel_r`

A list of integers. The length of the list should be the same as the number of atom types in the system. `sel_r[i]` gives the selected number of type-*i* neighbors. Only relative distance of the neighbors are used by the descriptor. `sel_a[i] + sel_r[i]` is recommended to be larger than the maximally possible number of type-*i* neighbors in the cut-off radius.

`rcut`:

type: float, optional, default: 6.0

argument path: `model/descriptor[loc_frame]/rcut`

The cut-off radius. The default value is 6.0

`axis_rule`:

type: list

argument path: `model/descriptor[loc_frame]/axis_rule`

A list of integers. The length should be 6 times of the number of types.

- `axis_rule[i*6+0]`: class of the atom defining the first axis of type-*i* atom. 0 for neighbors with full coordinates and 1 for neighbors only with relative distance.
- `axis_rule[i*6+1]`: type of the atom defining the first axis of type-*i* atom.
- `axis_rule[i*6+2]`: index of the axis atom defining the first axis. Note that the neighbors with the same class and type are sorted according to their relative distance.
- `axis_rule[i*6+3]`: class of the atom defining the second axis of type-*i* atom. 0 for neighbors with full coordinates and 1 for neighbors only with relative distance.
- `axis_rule[i*6+4]`: type of the atom defining the second axis of type-*i* atom.

- `axis_rule[i*6+5]`: index of the axis atom defining the second axis. Note that the neighbors with the same class and type are sorted according to their relative distance.

When `type` is set to `se_e2_a` (or its alias `se_a`):

sel:

type: `str` | `list`, optional, default: `auto`
argument path: `model/descriptor[se_e2_a]/sel`

This parameter set the number of selected neighbors for each type of atom. It can be:

- `List[int]`. The length of the list should be the same as the number of atom types in the system. `sel[i]` gives the selected number of type-*i* neighbors. `sel[i]` is recommended to be larger than the maximally possible number of type-*i* neighbors in the cut-off radius. It is noted that the total sel value must be less than 4096 in a GPU environment.
- `str`. Can be “auto:factor” or “auto”. “factor” is a float number larger than 1. This option will automatically determine the sel. In detail it counts the maximal number of neighbors with in the cutoff radius for each type of neighbor, then multiply the maximum by the “factor”. Finally the number is wrapped up to 4 divisible. The option “auto” is equivalent to “auto:1.1”.

rcut:

type: `float`, optional, default: 6.0
argument path: `model/descriptor[se_e2_a]/rcut`

The cut-off radius.

rcut_smth:

type: `float`, optional, default: 0.5
argument path: `model/descriptor[se_e2_a]/rcut_smth`

Where to start smoothing. For example the $1/r$ term is smoothed from `rcut` to `rcut_smth`

neuron:

type: `list`, optional, default: [10, 20, 40]
argument path: `model/descriptor[se_e2_a]/neuron`

Number of neurons in each hidden layers of the embedding net. When two layers are of the same size or one layer is twice as large as the previous layer, a skip connection is built.

axis_neuron:

type: `int`, optional, default: 4, alias: `n_axis_neuron`
argument path: `model/descriptor[se_e2_a]/axis_neuron`

Size of the submatrix of *G* (embedding matrix).

activation_function:

type: `str`, optional, default: `tanh`
argument path: `model/descriptor[se_e2_a]/activation_function`

The activation function in the embedding net. Supported activation functions are “relu”, “relu6”, “softplus”, “sigmoid”, “tanh”, “gelu”, “gelu_tf”, “None”, “none”. Note that “gelu” denotes the custom operator version,

and “gelu_tf” denotes the TF standard version. If you set “None” or “none” here, no activation function will be used.

resnet_dt:

type: bool, optional, default: False

argument path: model/descriptor[se_e2_a]/resnet_dt

Whether to use a “Timestep” in the skip connection

type_one_side:

type: bool, optional, default: False

argument path: model/descriptor[se_e2_a]/type_one_side

If true, the embedding network parameters vary by types of neighbor atoms only, so there will be N_{types} sets of embedding network parameters. Otherwise, the embedding network parameters vary by types of centric atoms and types of neighbor atoms, so there will be N_{types}^2 sets of embedding network parameters.

precision:

type: str, optional, default: default

argument path: model/descriptor[se_e2_a]/precision

The precision of the embedding net parameters, supported options are “default”, “float16”, “float32”, “float64”, “bfloat16”. Default follows the interface precision.

trainable:

type: bool, optional, default: True

argument path: model/descriptor[se_e2_a]/trainable

If the parameters in the embedding net is trainable

seed:

type: NoneType | int, optional

argument path: model/descriptor[se_e2_a]/seed

Random seed for parameter initialization

exclude_types:

type: list, optional, default: []

argument path: model/descriptor[se_e2_a]/exclude_types

The excluded pairs of types which have no interaction with each other. For example, [[0, 1]] means no interaction between type 0 and type 1.

set_davg_zero:

type: bool, optional, default: False

argument path: model/descriptor[se_e2_a]/set_davg_zero

Set the normalization average to zero. This option should be set when atom_ener in the energy fitting is used

When `type` is set to `se_e3` (or its aliases `se_at`, `se_a_3be`, `se_t`):

sel:

type: str | list, optional, default: auto

argument path: `model/descriptor[se_e3]/sel`

This parameter set the number of selected neighbors for each type of atom. It can be:

- List[int]. The length of the list should be the same as the number of atom types in the system. `sel[i]` gives the selected number of type-*i* neighbors. `sel[i]` is recommended to be larger than the maximally possible number of type-*i* neighbors in the cut-off radius. It is noted that the total sel value must be less than 4096 in a GPU environment.
- str. Can be “auto:factor” or “auto”. “factor” is a float number larger than 1. This option will automatically determine the sel. In detail it counts the maximal number of neighbors with in the cutoff radius for each type of neighbor, then multiply the maximum by the “factor”. Finally the number is wrapped up to 4 divisible. The option “auto” is equivalent to “auto:1.1”.

rcut:

type: float, optional, default: 6.0

argument path: `model/descriptor[se_e3]/rcut`

The cut-off radius.

rcut_smth:

type: float, optional, default: 0.5

argument path: `model/descriptor[se_e3]/rcut_smth`

Where to start smoothing. For example the $1/r$ term is smoothed from `rcut` to `rcut_smth`

neuron:

type: list, optional, default: [10, 20, 40]

argument path: `model/descriptor[se_e3]/neuron`

Number of neurons in each hidden layers of the embedding net. When two layers are of the same size or one layer is twice as large as the previous layer, a skip connection is built.

activation_function:

type: str, optional, default: tanh

argument path: `model/descriptor[se_e3]/activation_function`

The activation function in the embedding net. Supported activation functions are “relu”, “relu6”, “softplus”, “sigmoid”, “tanh”, “gelu”, “gelu_tf”, “None”, “none”. Note that “gelu” denotes the custom operator version, and “gelu_tf” denotes the TF standard version. If you set “None” or “none” here, no activation function will be used.

resnet_dt:

type: bool, optional, default: False

argument path: `model/descriptor[se_e3]/resnet_dt`

Whether to use a “Timestep” in the skip connection

precision:

type: str, optional, default: default

argument path: `model/descriptor[se_e3]/precision`

The precision of the embedding net parameters, supported options are “default”, “float16”, “float32”, “float64”, “bfloat16”. Default follows the interface precision.

trainable:

type: bool, optional, default: True
 argument path: model/descriptor[se_e3]/trainable

If the parameters in the embedding net are trainable

seed:

type: NoneType | int, optional
 argument path: model/descriptor[se_e3]/seed

Random seed for parameter initialization

set_davg_zero:

type: bool, optional, default: False
 argument path: model/descriptor[se_e3]/set_davg_zero

Set the normalization average to zero. This option should be set when atom_ener in the energy fitting is used

When `type` is set to `se_a_tpe` (or its alias `se_a_ebd`):

sel:

type: str | list, optional, default: auto
 argument path: model/descriptor[se_a_tpe]/sel

This parameter set the number of selected neighbors for each type of atom. It can be:

- List[int]. The length of the list should be the same as the number of atom types in the system. `sel[i]` gives the selected number of type-i neighbors. `sel[i]` is recommended to be larger than the maximally possible number of type-i neighbors in the cut-off radius. It is noted that the total sel value must be less than 4096 in a GPU environment.
- str. Can be “auto:factor” or “auto”. “factor” is a float number larger than 1. This option will automatically determine the sel. In detail it counts the maximal number of neighbors with in the cutoff radius for each type of neighbor, then multiply the maximum by the “factor”. Finally the number is wrapped up to 4 divisible. The option “auto” is equivalent to “auto:1.1”.

rcut:

type: float, optional, default: 6.0
 argument path: model/descriptor[se_a_tpe]/rcut

The cut-off radius.

rcut_smth:

type: float, optional, default: 0.5
 argument path: model/descriptor[se_a_tpe]/rcut_smth

Where to start smoothing. For example the $1/r$ term is smoothed from `rcut` to `rcut_smth`

neuron:

type: list, optional, default: [10, 20, 40]

argument path: `model/descriptor[se_a_tpe]/neuron`

Number of neurons in each hidden layers of the embedding net. When two layers are of the same size or one layer is twice as large as the previous layer, a skip connection is built.

axis_neuron:

type: `int`, optional, default: 4, alias: `n_axis_neuron`

argument path: `model/descriptor[se_a_tpe]/axis_neuron`

Size of the submatrix of G (embedding matrix).

activation_function:

type: `str`, optional, default: `tanh`

argument path: `model/descriptor[se_a_tpe]/activation_function`

The activation function in the embedding net. Supported activation functions are “relu”, “relu6”, “softplus”, “sigmoid”, “tanh”, “gelu”, “gelu_tf”, “None”, “none”. Note that “gelu” denotes the custom operator version, and “gelu_tf” denotes the TF standard version. If you set “None” or “none” here, no activation function will be used.

resnet_dt:

type: `bool`, optional, default: `False`

argument path: `model/descriptor[se_a_tpe]/resnet_dt`

Whether to use a “Timestep” in the skip connection

type_one_side:

type: `bool`, optional, default: `False`

argument path: `model/descriptor[se_a_tpe]/type_one_side`

If true, the embedding network parameters vary by types of neighbor atoms only, so there will be N_{types} sets of embedding network parameters. Otherwise, the embedding network parameters vary by types of centric atoms and types of neighbor atoms, so there will be N_{types}^2 sets of embedding network parameters.

precision:

type: `str`, optional, default: `default`

argument path: `model/descriptor[se_a_tpe]/precision`

The precision of the embedding net parameters, supported options are “default”, “float16”, “float32”, “float64”, “bfloat16”. Default follows the interface precision.

trainable:

type: `bool`, optional, default: `True`

argument path: `model/descriptor[se_a_tpe]/trainable`

If the parameters in the embedding net is trainable

seed:

type: `NoneType` | `int`, optional

argument path: `model/descriptor[se_a_tpe]/seed`

Random seed for parameter initialization

exclude_types:

type: list, optional, default: []

argument path: model/descriptor[se_a_tpe]/exclude_types

The excluded pairs of types which have no interaction with each other.

For example, [[0, 1]] means no interaction between type 0 and type 1.

set_davg_zero:

type: bool, optional, default: False

argument path: model/descriptor[se_a_tpe]/set_davg_zero

Set the normalization average to zero. This option should be set when atom_ener in the energy fitting is used

type_nchanl:

type: int, optional, default: 4

argument path: model/descriptor[se_a_tpe]/type_nchanl

number of channels for type embedding

type_nlayer:

type: int, optional, default: 2

argument path: model/descriptor[se_a_tpe]/type_nlayer

number of hidden layers of type embedding net

numb_aparam:

type: int, optional, default: 0

argument path: model/descriptor[se_a_tpe]/numb_aparam

dimension of atomic parameter. if set to a value > 0 , the atomic parameters are embedded.

When `type` is set to `se_e2_r` (or its alias `se_r`):

sel:

type: str | list, optional, default: auto

argument path: model/descriptor[se_e2_r]/sel

This parameter set the number of selected neighbors for each type of atom. It can be:

- List[int]. The length of the list should be the same as the number of atom types in the system. `sel[i]` gives the selected number of type-*i* neighbors. `sel[i]` is recommended to be larger than the maximally possible number of type-*i* neighbors in the cut-off radius. It is noted that the total sel value must be less than 4096 in a GPU environment.
- str. Can be “auto:factor” or “auto”. “factor” is a float number larger than 1. This option will automatically determine the sel. In detail it counts the maximal number of neighbors with in the cutoff radius for each type of neighbor, then multiply the maximum by the “factor”. Finally the number is wrapped up to 4 divisible. The option “auto” is equivalent to “auto:1.1”.

rcut:

type: float, optional, default: 6.0

argument path: model/descriptor[se_e2_r]/rcut

The cut-off radius.

rcut_smth:

type: float, optional, default: 0.5

argument path: model/descriptor[se_e2_r]/rcut_smth

Where to start smoothing. For example the $1/r$ term is smoothed from rcut to rcut_smth

neuron:

type: list, optional, default: [10, 20, 40]

argument path: model/descriptor[se_e2_r]/neuron

Number of neurons in each hidden layers of the embedding net. When two layers are of the same size or one layer is twice as large as the previous layer, a skip connection is built.

activation_function:

type: str, optional, default: tanh

argument path: model/descriptor[se_e2_r]/activation_function

The activation function in the embedding net. Supported activation functions are “relu”, “relu6”, “softplus”, “sigmoid”, “tanh”, “gelu”, “gelu_tf”, “None”, “none”. Note that “gelu” denotes the custom operator version, and “gelu_tf” denotes the TF standard version. If you set “None” or “none” here, no activation function will be used.

resnet_dt:

type: bool, optional, default: False

argument path: model/descriptor[se_e2_r]/resnet_dt

Whether to use a “Timestep” in the skip connection

type_one_side:

type: bool, optional, default: False

argument path: model/descriptor[se_e2_r]/type_one_side

If true, the embedding network parameters vary by types of neighbor atoms only, so there will be $N_{\text{text}}\{\text{types}\}$ sets of embedding network parameters. Otherwise, the embedding network parameters vary by types of centric atoms and types of neighbor atoms, so there will be $N_{\text{text}}\{\text{types}\}^2$ sets of embedding network parameters.

precision:

type: str, optional, default: default

argument path: model/descriptor[se_e2_r]/precision

The precision of the embedding net parameters, supported options are “default”, “float16”, “float32”, “float64”, “bfloat16”. Default follows the interface precision.

trainable:

type: bool, optional, default: True

argument path: model/descriptor[se_e2_r]/trainable

If the parameters in the embedding net are trainable

seed:

type: NoneType | int, optional

argument path: `model/descriptor[se_e2_r]/seed`

Random seed for parameter initialization

exclude_types:

type: list, optional, default: []

argument path: `model/descriptor[se_e2_r]/exclude_types`

The excluded pairs of types which have no interaction with each other. For example, `[[0, 1]]` means no interaction between type 0 and type 1.

set_davg_zero:

type: bool, optional, default: False

argument path: `model/descriptor[se_e2_r]/set_davg_zero`

Set the normalization average to zero. This option should be set when `atom_ener` in the energy fitting is used

When `type` is set to `hybrid`:

list:

type: list

argument path: `model/descriptor[hybrid]/list`

A list of descriptor definitions

When `type` is set to `se_atten`:

sel:

type: list | str | int, optional, default: auto

argument path: `model/descriptor[se_atten]/sel`

This parameter set the number of selected neighbors. Note that this parameter is a little different from that in other descriptors. Instead of separating each type of atoms, only the summation matters. And this number is highly related with the efficiency, thus one should not make it too large. Usually 200 or less is enough, far away from the GPU limitation 4096. It can be:

- int. The maximum number of neighbor atoms to be considered. We recommend it to be less than 200.
- List[int]. The length of the list should be the same as the number of atom types in the system. `sel[i]` gives the selected number of type-*i* neighbors. Only the summation of `sel[i]` matters, and it is recommended to be less than 200.
- str. Can be “auto:factor” or “auto”. “factor” is a float number larger than 1. This option will automatically determine the sel. In detail it counts the maximal number of neighbors with in the cutoff radius for each type of neighbor, then multiply the maximum by the “factor”. Finally the number is wrapped up to 4 divisible. The option “auto” is equivalent to “auto:1.1”.

rcut:

type: float, optional, default: 6.0

argument path: `model/descriptor[se_atten]/rcut`

The cut-off radius.

rcut_smth:

type: float, optional, default: 0.5

argument path: `model/descriptor[se_atten]/rcut_smth`

Where to start smoothing. For example the $1/r$ term is smoothed from `rcut` to `rcut_smth`

neuron:

type: `list`, optional, default: `[10, 20, 40]`

argument path: `model/descriptor[se_atten]/neuron`

Number of neurons in each hidden layers of the embedding net. When two layers are of the same size or one layer is twice as large as the previous layer, a skip connection is built.

axis_neuron:

type: `int`, optional, default: `4`, alias: `n_axis_neuron`

argument path: `model/descriptor[se_atten]/axis_neuron`

Size of the submatrix of G (embedding matrix).

activation_function:

type: `str`, optional, default: `tanh`

argument path: `model/descriptor[se_atten]/activation_function`

The activation function in the embedding net. Supported activation functions are “relu”, “relu6”, “softplus”, “sigmoid”, “tanh”, “gelu”, “gelu_tf”, “None”, “none”. Note that “gelu” denotes the custom operator version, and “gelu_tf” denotes the TF standard version. If you set “None” or “none” here, no activation function will be used.

resnet_dt:

type: `bool`, optional, default: `False`

argument path: `model/descriptor[se_atten]/resnet_dt`

Whether to use a “Timestep” in the skip connection

type_one_side:

type: `bool`, optional, default: `False`

argument path: `model/descriptor[se_atten]/type_one_side`

If true, the embedding network parameters vary by types of neighbor atoms only, so there will be $N_{\text{text}}\{\text{types}\}$ sets of embedding network parameters. Otherwise, the embedding network parameters vary by types of centric atoms and types of neighbor atoms, so there will be $N_{\text{text}}\{\text{types}\}^2$ sets of embedding network parameters.

precision:

type: `str`, optional, default: `default`

argument path: `model/descriptor[se_atten]/precision`

The precision of the embedding net parameters, supported options are “default”, “float16”, “float32”, “float64”, “bfloat16”. Default follows the interface precision.

trainable:

type: `bool`, optional, default: `True`

argument path: `model/descriptor[se_atten]/trainable`

If the parameters in the embedding net is trainable

seed:
 type: `NoneType` | `int`, optional
 argument path: `model/descriptor[se_atten]/seed`
 Random seed for parameter initialization

exclude_types:
 type: `list`, optional, default: `[]`
 argument path: `model/descriptor[se_atten]/exclude_types`
 The excluded pairs of types which have no interaction with each other.
 For example, `[[0, 1]]` means no interaction between type 0 and type 1.

set_davg_zero:
 type: `bool`, optional, default: `True`
 argument path: `model/descriptor[se_atten]/set_davg_zero`
 Set the normalization average to zero. This option should be set when `se_atten` descriptor or `atom_ener` in the energy fitting is used

attn:
 type: `int`, optional, default: 128
 argument path: `model/descriptor[se_atten]/attn`
 The length of hidden vectors in attention layers

attn_layer:
 type: `int`, optional, default: 2
 argument path: `model/descriptor[se_atten]/attn_layer`
 The number of attention layers

attn_dotr:
 type: `bool`, optional, default: `True`
 argument path: `model/descriptor[se_atten]/attn_dotr`
 Whether to do dot product with the normalized relative coordinates

attn_mask:
 type: `bool`, optional, default: `False`
 argument path: `model/descriptor[se_atten]/attn_mask`
 Whether to do mask on the diagonal in the attention matrix

When `type` is set to `se_a_mask`:

sel:
 type: `str` | `list`, optional, default: `auto`
 argument path: `model/descriptor[se_a_mask]/sel`
 This parameter sets the number of selected neighbors for each type of atom. It can be:

- `List[int]`. The length of the list should be the same as the number of atom types in the system. `sel[i]` gives the selected number of type-*i* neighbors. `sel[i]` is recommended to be larger than the maximally possible number of type-*i* neighbors in the cut-off radius. It is noted that the total `sel` value must be less than 4096 in a GPU environment.

- str. Can be “auto:factor” or “auto”. “factor” is a float number larger than 1. This option will automatically determine the sel. In detail it counts the maximal number of neighbors with in the cutoff radius for each type of neighbor, then multiply the maximum by the “factor”. Finally the number is wrapped up to 4 divisible. The option “auto” is equivalent to “auto:1.1”.

neuron:

type: list, optional, default: [10, 20, 40]
argument path: model/descriptor[se_a_mask]/neuron

Number of neurons in each hidden layers of the embedding net. When two layers are of the same size or one layer is twice as large as the previous layer, a skip connection is built.

axis_neuron:

type: int, optional, default: 4, alias: n_axis_neuron
argument path: model/descriptor[se_a_mask]/axis_neuron

Size of the submatrix of G (embedding matrix).

activation_function:

type: str, optional, default: tanh
argument path:
model/descriptor[se_a_mask]/activation_function

The activation function in the embedding net. Supported activation functions are “relu”, “relu6”, “softplus”, “sigmoid”, “tanh”, “gelu”, “gelu_tf”, “None”, “none”. Note that “gelu” denotes the custom operator version, and “gelu_tf” denotes the TF standard version. If you set “None” or “none” here, no activation function will be used.

resnet_dt:

type: bool, optional, default: False
argument path: model/descriptor[se_a_mask]/resnet_dt

Whether to use a “Timestep” in the skip connection

type_one_side:

type: bool, optional, default: False
argument path: model/descriptor[se_a_mask]/type_one_side

If true, the embedding network parameters vary by types of neighbor atoms only, so there will be N_{types} sets of embedding network parameters. Otherwise, the embedding network parameters vary by types of centric atoms and types of neighbor atoms, so there will be N_{types}^2 sets of embedding network parameters.

exclude_types:

type: list, optional, default: []
argument path: model/descriptor[se_a_mask]/exclude_types

The excluded pairs of types which have no interaction with each other. For example, [[0, 1]] means no interaction between type 0 and type 1.

precision:

type: str, optional, default: default

argument path: `model/descriptor[se_a_mask]/precision`

The precision of the embedding net parameters, supported options are “default”, “float16”, “float32”, “float64”, “bfloat16”. Default follows the interface precision.

trainable:

type: bool, optional, default: True

argument path: `model/descriptor[se_a_mask]/trainable`

If the parameters in the embedding net is trainable

seed:

type: NoneType | int, optional

argument path: `model/descriptor[se_a_mask]/seed`

Random seed for parameter initialization

fitting_net:

type: dict, optional

argument path: `model/fitting_net`

The fitting of physical properties.

Depending on the value of type, different sub args are accepted.

type:

type: str (flag key), default: ener

argument path: `model/fitting_net/type`

possible choices: *ener*, *dipole*, *polar*

The type of the fitting. See explanation below.

- *ener*: Fit an energy model (potential energy surface).
- *dipole*: Fit an atomic dipole model. Global dipole labels or atomic dipole labels for all the selected atoms (see `sel_type`) should be provided by `dipole.npy` in each data system. The file either has number of frames lines and 3 times of number of selected atoms columns, or has number of frames lines and 3 columns. See `loss` parameter.
- *polar*: Fit an atomic polarizability model. Global polarizability labels or atomic polarizability labels for all the selected atoms (see `sel_type`) should be provided by `polarizability.npy` in each data system. The file either has number of frames lines and 9 times of number of selected atoms columns, or has number of frames lines and 9 columns. See `loss` parameter.

When *type* is set to *ener*:

numb_fparam:

type: int, optional, default: 0

argument path: `model/fitting_net[ener]/numb_fparam`

The dimension of the frame parameter. If set to >0, file `fparam.npy` should be included to provided the input fparams.

numb_aparam:

type: int, optional, default: 0

argument path: `model/fitting_net[ener]/numb_aparam`

The dimension of the atomic parameter. If set to >0, file `aparam.npy` should be included to provided the input aparams.

neuron:

type: list, optional, default: [120, 120, 120], alias: n_neuron
argument path: model/fitting_net[ener]/neuron

The number of neurons in each hidden layers of the fitting net. When two hidden layers are of the same size, a skip connection is built.

activation_function:

type: str, optional, default: tanh
argument path: model/fitting_net[ener]/activation_function

The activation function in the fitting net. Supported activation functions are “relu”, “relu6”, “softplus”, “sigmoid”, “tanh”, “gelu”, “gelu_tf”, “None”, “none”. Note that “gelu” denotes the custom operator version, and “gelu_tf” denotes the TF standard version. If you set “None” or “none” here, no activation function will be used.

precision:

type: str, optional, default: default
argument path: model/fitting_net[ener]/precision

The precision of the fitting net parameters, supported options are “default”, “float16”, “float32”, “float64”, “bfloat16”. Default follows the interface precision.

resnet_dt:

type: bool, optional, default: True
argument path: model/fitting_net[ener]/resnet_dt

Whether to use a “Timestep” in the skip connection

trainable:

type: bool | list, optional, default: True
argument path: model/fitting_net[ener]/trainable

Whether the parameters in the fitting net are trainable. This option can be

- bool: True if all parameters of the fitting net are trainable, False otherwise.
- list of bool: Specifies if each layer is trainable. Since the fitting net is composed by hidden layers followed by a output layer, the length of this list should be equal to len(neuron)+1.

rcond:

type: float, optional, default: 0.001
argument path: model/fitting_net[ener]/rcond

The condition number used to determine the initial energy shift for each type of atoms.

seed:

type: NoneType | int, optional
argument path: model/fitting_net[ener]/seed

Random seed for parameter initialization of the fitting net

atom_ener:

type: list, optional, default: []

argument path: `model/fitting_net[ener]/atom_ener`

Specify the atomic energy in vacuum for each type

layer_name:

type: `list`, optional

argument path: `model/fitting_net[ener]/layer_name`

The name of the each layer. The length of this list should be equal to `n_neuron + 1`. If two layers, either in the same fitting or different fittings, have the same name, they will share the same neural network parameters. The shape of these layers should be the same. If null is given for a layer, parameters will not be shared.

use_aparam_as_mask:

type: `bool`, optional, default: `False`

argument path: `model/fitting_net[ener]/use_aparam_as_mask`

Whether to use the aparam as a mask in input. If `True`, the aparam will not be used in fitting net for embedding. When `descript` is `se_a_mask`, the aparam will be used as a mask to indicate the input atom is real/virtual. And `use_aparam_as_mask` should be set to `True`.

When `type` is set to `dipole`:

neuron:

type: `list`, optional, default: `[120, 120, 120]`, alias: `n_neuron`

argument path: `model/fitting_net[dipole]/neuron`

The number of neurons in each hidden layers of the fitting net. When two hidden layers are of the same size, a skip connection is built.

activation_function:

type: `str`, optional, default: `tanh`

argument path: `model/fitting_net[dipole]/activation_function`

The activation function in the fitting net. Supported activation functions are “`relu`”, “`relu6`”, “`softplus`”, “`sigmoid`”, “`tanh`”, “`gelu`”, “`gelu_tf`”, “`None`”, “`none`”. Note that “`gelu`” denotes the custom operator version, and “`gelu_tf`” denotes the TF standard version. If you set “`None`” or “`none`” here, no activation function will be used.

resnet_dt:

type: `bool`, optional, default: `True`

argument path: `model/fitting_net[dipole]/resnet_dt`

Whether to use a “Timestep” in the skip connection

precision:

type: `str`, optional, default: `default`

argument path: `model/fitting_net[dipole]/precision`

The precision of the fitting net parameters, supported options are “`default`”, “`float16`”, “`float32`”, “`float64`”, “`bfloat16`”. Default follows the interface precision.

sel_type:

type: `int` | `NoneType` | `list`, optional, alias: `dipole_type`

argument path: `model/fitting_net[dipole]/sel_type`

The atom types for which the atomic dipole will be provided. If not set, all types will be selected.

seed:

type: `NoneType` | `int`, optional

argument path: `model/fitting_net[dipole]/seed`

Random seed for parameter initialization of the fitting net

When `type` is set to `polar`:

neuron:

type: `list`, optional, default: `[120, 120, 120]`, alias: `n_neuron`

argument path: `model/fitting_net[polar]/neuron`

The number of neurons in each hidden layers of the fitting net. When two hidden layers are of the same size, a skip connection is built.

activation_function:

type: `str`, optional, default: `tanh`

argument path: `model/fitting_net[polar]/activation_function`

The activation function in the fitting net. Supported activation functions are “relu”, “relu6”, “softplus”, “sigmoid”, “tanh”, “gelu”, “gelu_tf”, “None”, “none”. Note that “gelu” denotes the custom operator version, and “gelu_tf” denotes the TF standard version. If you set “None” or “none” here, no activation function will be used.

resnet_dt:

type: `bool`, optional, default: `True`

argument path: `model/fitting_net[polar]/resnet_dt`

Whether to use a “Timestep” in the skip connection

precision:

type: `str`, optional, default: `default`

argument path: `model/fitting_net[polar]/precision`

The precision of the fitting net parameters, supported options are “default”, “float16”, “float32”, “float64”, “bfloat16”. Default follows the interface precision.

fit_diag:

type: `bool`, optional, default: `True`

argument path: `model/fitting_net[polar]/fit_diag`

Fit the diagonal part of the rotational invariant polarizability matrix, which will be converted to normal polarizability matrix by contracting with the rotation matrix.

scale:

type: `float` | `list`, optional, default: `1.0`

argument path: `model/fitting_net[polar]/scale`

The output of the fitting net (polarizability matrix) will be scaled by `scale`

shift_diag:

type: bool, optional, default: True

argument path: model/fitting_net[polar]/shift_diag

Whether to shift the diagonal of polar, which is beneficial to training. Default is true.

sel_type:

type: int | NoneType | list, optional, alias: pol_type

argument path: model/fitting_net[polar]/sel_type

The atom types for which the atomic polarizability will be provided. If not set, all types will be selected.

seed:

type: NoneType | int, optional

argument path: model/fitting_net[polar]/seed

Random seed for parameter initialization of the fitting net

fitting_net_dict:

type: dict, optional

argument path: model/fitting_net_dict

The dictionary of multiple fitting nets in multi-task mode. Each fitting_net_dict[fitting_key] is the single definition of fitting of physical properties with user-defined name fitting_key.

modifier:

type: dict, optional

argument path: model/modifier

The modifier of model output.

Depending on the value of type, different sub args are accepted.

type:

type: str (flag key)

argument path: model/modifier/type

possible choices: *dipole_charge*

The type of modifier. See explanation below.

-dipole_charge: Use WFCC to model the electronic structure of the system. Correct the long-range interaction

When *type* is set to *dipole_charge*:

model_name:

type: str

argument path: model/modifier[dipole_charge]/model_name

The name of the frozen dipole model file.

model_charge_map:

type: list

argument path: model/modifier[dipole_charge]/model_charge_map

The charge of the WFCC. The list length should be the same as the *sel_type*.

sys_charge_map:
type: list
argument path: model/modifier[dipole_charge]/sys_charge_map
The charge of real atoms. The list length should be the same as the [type_map](#)

ewald_beta:
type: float, optional, default: 0.4
argument path: model/modifier[dipole_charge]/ewald_beta
The splitting parameter of Ewald sum. Unit is \AA^{-1}

ewald_h:
type: float, optional, default: 1.0
argument path: model/modifier[dipole_charge]/ewald_h
The grid spacing of the FFT grid. Unit is \AA

compress:
type: dict, optional
argument path: model/compress
Model compression configurations
Depending on the value of type, different sub args are accepted.

type:
type: str (flag key), default: `se_e2_a`
argument path: model/compress/type
possible choices: [se_e2_a](#)
The type of model compression, which should be consistent with the descriptor type.

When [type](#) is set to `se_e2_a` (or its alias `se_a`):

model_file:
type: str
argument path: model/compress[se_e2_a]/model_file
The input model file, which will be compressed by the DeePMD-kit.

table_config:
type: list
argument path: model/compress[se_e2_a]/table_config
The arguments of model compression, including extrapolate(scale of model extrapolation), stride(uniform stride of tabulation's first and second table), and frequency(frequency of tabulation overflow check).

min_nbor_dist:
type: float
argument path: model/compress[se_e2_a]/min_nbor_dist
The nearest distance between neighbor atoms saved in the frozen model.

learning_rate:

type: dict

argument path: `learning_rate`

The definitio of learning rate

scale_by_worker:

type: `str`, optional, default: `linear`

argument path: `learning_rate/scale_by_worker`

When parallel training or batch size scaled, how to alter learning rate. Valid values are `linear`(default), `'sqrt'` or `none`.

Depending on the value of type, different sub args are accepted.

type:

type: `str` (flag key), default: `exp`

argument path: `learning_rate/type`

possible choices: `exp`

The type of the learning rate.

When `type` is set to `exp`:

start_lr:

type: `float`, optional, default: 0.001

argument path: `learning_rate[exp]/start_lr`

The learning rate the start of the training.

stop_lr:

type: `float`, optional, default: 1e-08

argument path: `learning_rate[exp]/stop_lr`

The desired learning rate at the end of the training.

decay_steps:

type: `int`, optional, default: 5000

argument path: `learning_rate[exp]/decay_steps`

The learning rate is decaying every this number of training steps.

loss:

type: dict, optional

argument path: `loss`

The definition of loss function. The loss type should be set to `tensor`, `ener` or left unset.

Depending on the value of type, different sub args are accepted.

type:

type: `str` (flag key), default: `ener`

argument path: `loss/type`

possible choices: `ener`, `tensor`

The type of the loss. When the fitting type is `ener`, the loss type should be set to `ener` or left unset. When the fitting type is `dipole` or `polar`, the loss type should be set to `tensor`.

When `type` is set to `ener`:

start_pref_e:

type: float | int, optional, default: 0.02
argument path: `loss[ener]/start_pref_e`

The prefactor of energy loss at the start of the training. Should be larger than or equal to 0. If set to none-zero value, the energy label should be provided by file `energy.npy` in each data system. If both `start_pref_energy` and `limit_pref_energy` are set to 0, then the energy will be ignored.

limit_pref_e:

type: float | int, optional, default: 1.0
argument path: `loss[ener]/limit_pref_e`

The prefactor of energy loss at the limit of the training, Should be larger than or equal to 0. i.e. the training step goes to infinity.

start_pref_f:

type: float | int, optional, default: 1000
argument path: `loss[ener]/start_pref_f`

The prefactor of force loss at the start of the training. Should be larger than or equal to 0. If set to none-zero value, the force label should be provided by file `force.npy` in each data system. If both `start_pref_force` and `limit_pref_force` are set to 0, then the force will be ignored.

limit_pref_f:

type: float | int, optional, default: 1.0
argument path: `loss[ener]/limit_pref_f`

The prefactor of force loss at the limit of the training, Should be larger than or equal to 0. i.e. the training step goes to infinity.

start_pref_v:

type: float | int, optional, default: 0.0
argument path: `loss[ener]/start_pref_v`

The prefactor of virial loss at the start of the training. Should be larger than or equal to 0. If set to none-zero value, the virial label should be provided by file `virial.npy` in each data system. If both `start_pref_virial` and `limit_pref_virial` are set to 0, then the virial will be ignored.

limit_pref_v:

type: float | int, optional, default: 0.0
argument path: `loss[ener]/limit_pref_v`

The prefactor of virial loss at the limit of the training, Should be larger than or equal to 0. i.e. the training step goes to infinity.

start_pref_ae:

type: float | int, optional, default: 0.0
argument path: `loss[ener]/start_pref_ae`

The prefactor of `atom_ener` loss at the start of the training. Should be larger than or equal to 0. If set to none-zero value, the `atom_ener` label should be provided by file `atom_ener.npy` in each data system. If both `start_pref_atom_ener` and `limit_pref_atom_ener` are set to 0, then the `atom_ener` will be ignored.

limit_pref_ae:

type: float | int, optional, default: 0.0
 argument path: `loss[ener]/limit_pref_ae`

The prefactor of atom_ener loss at the limit of the training, Should be larger than or equal to 0. i.e. the training step goes to infinity.

start_pref_pf:

type: float | int, optional, default: 0.0
 argument path: `loss[ener]/start_pref_pf`

The prefactor of atom_pref loss at the start of the training. Should be larger than or equal to 0. If set to none-zero value, the atom_pref label should be provided by file atom_pref.npy in each data system. If both start_pref_atom_pref and limit_pref_atom_pref are set to 0, then the atom_pref will be ignored.

limit_pref_pf:

type: float | int, optional, default: 0.0
 argument path: `loss[ener]/limit_pref_pf`

The prefactor of atom_pref loss at the limit of the training, Should be larger than or equal to 0. i.e. the training step goes to infinity.

relative_f:

type: float | NoneType, optional
 argument path: `loss[ener]/relative_f`

If provided, relative force error will be used in the loss. The difference of force will be normalized by the magnitude of the force in the label with a shift given by relative_f, i.e. $DF_i / (\|F\| + \text{relative_f})$ with DF denoting the difference between prediction and label and $\|F\|$ denoting the L2 norm of the label.

enable_atom_ener_coeff:

type: bool, optional, default: False
 argument path: `loss[ener]/enable_atom_ener_coeff`

If true, the energy will be computed as $\sum_i c_i E_i$. c_i should be provided by file atom_ener_coeff.npy in each data system, otherwise it's 1.

When `type` is set to `tensor`:

pref:

type: float | int
 argument path: `loss[tensor]/pref`

The prefactor of the weight of global loss. It should be larger than or equal to 0. It controls the weight of loss corresponding to global label, i.e. 'polarizability.npy' or dipole.npy, whose shape should be #frames x [9 or 3]. If it's larger than 0.0, this npy should be included.

pref_atomic:

type: float | int
 argument path: `loss[tensor]/pref_atomic`

The prefactor of the weight of atomic loss. It should be larger than or equal to 0. It controls the weight of loss corresponding to atomic label, i.e. atomic_polarizability.npy or atomic_dipole.npy, whose shape should be #frames x ([9 or 3] x #selected atoms). If it's larger than 0.0, this npy should be included. Both pref and pref_atomic should be provided, and either can be set to 0.0.

loss_dict:

type: dict, optional

argument path: `loss_dict`

The dictionary of definitions of multiple loss functions in multi-task mode. Each `loss_dict[fitting_key]`, with user-defined name `fitting_key` in `model/fitting_net_dict`, is the single definition of loss function, whose type should be set to tensor, ener or left unset.

training:

type: dict

argument path: `training`

The training options.

training_data:

type: dict, optional

argument path: `training/training_data`

Configurations of training data.

systems:

type: str | list

argument path: `training/training_data/systems`

The data systems for training. This key can be provided with a list that specifies the systems, or be provided with a string by which the prefix of all systems are given and the list of the systems is automatically generated.

set_prefix:

type: str, optional, default: set

argument path: `training/training_data/set_prefix`

The prefix of the sets in the [systems](#).

batch_size:

type: int | str | list, optional, default: auto

argument path: `training/training_data/batch_size`

This key can be

- list: the length of which is the same as the [systems](#). The batch size of each system is given by the elements of the list.
- int: all [systems](#) use the same batch size.
- string "auto": automatically determines the batch size so that the `batch_size` times the number of atoms in the system is no less than 32.
- string "auto:N": automatically determines the batch size so that the `batch_size` times the number of atoms in the system is no less than N.
- string "mixed:N": the batch data will be sampled from all systems and merged into a mixed system with the batch size N. Only support the `se_atten` descriptor.

auto_prob:

type: str, optional, default: `prob_sys_size`, alias: `auto_prob_style`

argument path: `training/training_data/auto_prob`

Determine the probability of systems automatically. The method is assigned by this key and can be

- “prob_uniform” : the probability all the systems are equal, namely $1.0/\text{self.get_nsystems}()$
- “prob_sys_size” : the probability of a system is proportional to the number of batches in the system
- “prob_sys_size;stt_idx:end_idx:weight;stt_idx:end_idx:weight;...” : the list of systems is divided into blocks. A block is specified by stt_idx:end_idx:weight, where stt_idx is the starting index of the system, end_idx is then ending (not including) index of the system, the probabilities of the systems in this block sums up to weight, and the relatively probabilities within this block is proportional to the number of batches in the system.

sys_probs:

type: `NoneType` | `list`, optional, default: `None`, alias: `sys_weights`
 argument path: `training/training_data/sys_probs`

A list of float if specified. Should be of the same length as systems, specifying the probability of each system.

validation_data:

type: `dict` | `NoneType`, optional, default: `None`
 argument path: `training/validation_data`

Configurations of validation data. Similar to that of training data, except that a `numb_btch` argument may be configured

systems:

type: `str` | `list`
 argument path: `training/validation_data/systems`

The data systems for validation. This key can be provided with a list that specifies the systems, or be provided with a string by which the prefix of all systems are given and the list of the systems is automatically generated.

set_prefix:

type: `str`, optional, default: `set`
 argument path: `training/validation_data/set_prefix`

The prefix of the sets in the [systems](#).

batch_size:

type: `int` | `str` | `list`, optional, default: `auto`
 argument path: `training/validation_data/batch_size`

This key can be

- `list`: the length of which is the same as the [systems](#). The batch size of each system is given by the elements of the list.
- `int`: all [systems](#) use the same batch size.
- string “auto”: automatically determines the batch size so that the `batch_size` times the number of atoms in the system is no less than 32.
- string “auto:N”: automatically determines the batch size so that the `batch_size` times the number of atoms in the system is no less than N.

auto_prob:

type: `str`, optional, default: `prob_sys_size`, alias: `auto_prob_style`
 argument path: `training/validation_data/auto_prob`

Determine the probability of systems automatically. The method is assigned by this key and can be

- “prob_uniform” : the probability all the systems are equal, namely `1.0/self.get_nsystems()`
- “prob_sys_size” : the probability of a system is proportional to the number of batches in the system
- “prob_sys_size;stt_idx:end_idx:weight;stt_idx:end_idx:weight;...” : the list of systems is divided into blocks. A block is specified by `stt_idx:end_idx:weight`, where `stt_idx` is the starting index of the system, `end_idx` is then ending (not including) index of the system, the probabilities of the systems in this block sums up to `weight`, and the relatively probabilities within this block is proportional to the number of batches in the system.

sys_probs:

type: `NoneType` | `list`, optional, default: `None`, alias: `sys_weights`
argument path: `training/validation_data/sys_probs`

A list of float if specified. Should be of the same length as systems, specifying the probability of each system.

numb_btch:

type: `int`, optional, default: `1`, alias: `numb_batch`
argument path: `training/validation_data/numb_btch`

An integer that specifies the number of batches to be sampled for each validation period.

mixed_precision:

type: `dict`, optional
argument path: `training/mixed_precision`

Configurations of mixed precision.

output_prec:

type: `str`, optional, default: `float32`
argument path: `training/mixed_precision/output_prec`

The precision for mixed precision params. ” “The trainable variables precision during the mixed precision training process, ” “supported options are float32 only currently.

compute_prec:

type: `str`
argument path: `training/mixed_precision/compute_prec`

The precision for mixed precision compute. ” “The compute precision during the mixed precision training process, ” “supported options are float16 and bfloat16 currently.

numb_steps:

type: `int`, alias: `stop_batch`
argument path: `training/numb_steps`

Number of training batch. Each training uses one batch of data.

seed:

type: `NoneType` | `int`, optional

argument path: `training/seed`

The random seed for getting frames from the training data set.

disp_file:

type: `str`, optional, default: `lcurve.out`

argument path: `training/disp_file`

The file for printing learning curve.

disp_freq:

type: `int`, optional, default: 1000

argument path: `training/disp_freq`

The frequency of printing learning curve.

save_freq:

type: `int`, optional, default: 1000

argument path: `training/save_freq`

The frequency of saving check point.

save_ckpt:

type: `str`, optional, default: `model.ckpt`

argument path: `training/save_ckpt`

The file name of saving check point.

disp_training:

type: `bool`, optional, default: `True`

argument path: `training/disp_training`

Displaying verbose information during training.

time_training:

type: `bool`, optional, default: `True`

argument path: `training/time_training`

Timing during training.

profiling:

type: `bool`, optional, default: `False`

argument path: `training/profiling`

Profiling during training.

profiling_file:

type: `str`, optional, default: `timeline.json`

argument path: `training/profiling_file`

Output file for profiling.

enable_profiler:

type: `bool`, optional, default: `False`

argument path: `training/enable_profiler`

Enable TensorFlow Profiler (available in TensorFlow 2.3) to analyze performance. The log will be saved to `tensorboard_log_dir`.

tensorboard:

type: bool, optional, default: False
argument path: `training/tensorboard`
Enable tensorboard

tensorboard_log_dir:

type: str, optional, default: log
argument path: `training/tensorboard_log_dir`
The log directory of tensorboard outputs

tensorboard_freq:

type: int, optional, default: 1
argument path: `training/tensorboard_freq`
The frequency of writing tensorboard events.

data_dict:

type: dict, optional
argument path: `training/data_dict`
The dictionary of multi DataSystems in multi-task mode. Each `data_dict[fitting_key]`, with user-defined name `fitting_key` in `model/fitting_net_dict`, contains training data and optional validation data definitions.

fitting_weight:

type: dict, optional
argument path: `training/fitting_weight`
Each `fitting_weight[fitting_key]`, with user-defined name `fitting_key` in `model/fitting_net_dict`, is the training weight of fitting net `fitting_key`. Fitting nets with higher weights will be selected with higher probabilities to be trained in one step. Weights will be normalized and minus ones will be ignored. If not set, each fitting net will be equally selected when training.

nvnmmd:

type: dict, optional
argument path: `nvnmmd`
The nvnmmd options.

net_size:

type: int
argument path: `nvnmmd/net_size`
configuration the number of nodes of fitting_net, just can be set as 128

map_file:

type: str
argument path: `nvnmmd/map_file`
A file containing the mapping tables to replace the calculation of embedding nets

config_file:

type: str

```

    argument path: nvnmmd/config_file
    A file containing the parameters about how to implement the model in certain
    hardware

weight_file:
    type: str
    argument path: nvnmmd/weight_file
    a *.npz file containing the weights of the model

enable:
    type: bool
    argument path: nvnmmd/enable
    enable the nvnmmd training

restore_descriptor:
    type: bool
    argument path: nvnmmd/restore_descriptor
    enable to restore the parameter of embedding_net from weight.npz

restore_fitting_net:
    type: bool
    argument path: nvnmmd/restore_fitting_net
    enable to restore the parameter of fitting_net from weight.npz

quantize_descriptor:
    type: bool
    argument path: nvnmmd/quantize_descriptor
    enable the quantization of descriptor

quantize_fitting_net:
    type: bool
    argument path: nvnmmd/quantize_fitting_net
    enable the quantization of fitting_net

```

5.4 Parallel training

Currently, parallel training is enabled in a synchronized way with help of [Horovod](#). Depending on the number of training processes (according to MPI context) and the number of GPU cards available, DeePMD-kit will decide whether to launch the training in parallel (distributed) mode or in serial mode. Therefore, no additional options are specified in your JSON/YAML input file.

5.4.1 Tuning learning rate

Horovod works in the data-parallel mode, resulting in a larger global batch size. For example, the real batch size is 8 when `batch_size` is set to 2 in the input file and you launch 4 workers. Thus, `learning_rate` is automatically scaled by the number of workers for better convergence. Technical details of such heuristic rule are discussed at [Accurate, Large Minibatch SGD: Training ImageNet in 1 Hour](#).

The number of decay steps required to achieve the same accuracy can decrease by the number of cards (e.g., 1/2 of steps in the above case), but needs to be scaled manually in the input file.

In some cases, it won't work well when scaling the learning rate by worker count in a linear way. Then you can try `sqrt` or `none` by setting argument `scale_by_worker` like below.

```
"learning_rate" :{
  "scale_by_worker": "none",
  "type": "exp"
}
```

5.4.2 Scaling test

Testing `examples/water/se_e2_a` on an 8-GPU host, linear acceleration can be observed with the increasing number of cards.

Num of GPU cards	Seconds every 100 samples	Samples per second	Speed up
1	1.4515	68.89	1.00
2	1.5962	62.65*2	1.82
4	1.7635	56.71*4	3.29
8	1.7267	57.91*8	6.72

5.4.3 How to use

Training workers can be launched with `horovodrun`. The following command launches 4 processes on the same host:

```
CUDA_VISIBLE_DEVICES=4,5,6,7 horovodrun -np 4 \
dp train --mpi-log=workers input.json
```

Need to mention, the environment variable '`CUDA_VISIBLE_DEVICES`' must be set to control parallelism on the occupied host where one process is bound to one GPU card.

To maximize the performance, one should follow [FAQ: How to control the parallelism of a job](#) to control the number of threads.

When using MPI with Horovod, `horovodrun` is a simple wrapper around `mpirun`. In the case where fine-grained control over options is passed to `mpirun`, `mpirun` can be invoked directly, and it will be detected automatically by Horovod, e.g.,

```
CUDA_VISIBLE_DEVICES=4,5,6,7 mpirun -l -launcher=fork -hosts=localhost -np 4 \
dp train --mpi-log=workers input.json
```

this is sometimes necessary for an HPC environment.

Whether distributed workers are initiated can be observed in the "Summary of the training" section in the log (`world size > 1`, and `distributed`).

```
[0] DEEPMO INFO    ---Summary of the training-----
[0] DEEPMO INFO    distributed
[0] DEEPMO INFO    world size:           4
[0] DEEPMO INFO    my rank:              0
[0] DEEPMO INFO    node list:             ['exp-13-57']
[0] DEEPMO INFO    running on:           exp-13-57
[0] DEEPMO INFO    computing device:      gpu:0
[0] DEEPMO INFO    CUDA_VISIBLE_DEVICES: 0,1,2,3
[0] DEEPMO INFO    Count of visible GPU:  4
[0] DEEPMO INFO    num_intra_threads:     0
[0] DEEPMO INFO    num_inter_threads:     0
[0] DEEPMO INFO    -----
```

5.4.4 Logging

What's more, 2 command-line arguments are defined to control the logging behavior when performing parallel training with MPI.

```
optional arguments:
  -l LOG_PATH, --log-path LOG_PATH
                        set log file to log messages to disk, if not
                        specified, the logs will only be output to console
                        (default: None)
  -m {master,collect,workers}, --mpi-log {master,collect,workers}
                        Set the manner of logging when running with MPI.
                        'master' logs only on main process, 'collect'
                        broadcasts logs from workers to master and 'workers'
                        means each process will output its own log (default:
                        master)
```

5.5 Multi-task training

5.5.1 Perform the multi-task training

Training on multiple data sets (each data set contains several data systems) can be performed in multi-task mode, with one common descriptor and multiple specific fitting nets for each data set. One can simply switch the following parameters in training input script to perform multi-task mode:

- `fitting_net` -> `fitting_net_dict`, each key of which can be one individual fitting net.
- `training_data`, `validation_data` -> `data_dict`, each key of which can be one individual data set contains several data systems for corresponding fitting net, the keys must be consistent with those in `fitting_net_dict`.
- `loss` -> `loss_dict`, each key of which can be one individual loss setting for corresponding fitting net, the keys must be consistent with those in `fitting_net_dict`, if not set, the corresponding fitting net will use the default loss.
- (Optional) `fitting_weight`, each key of which can be a non-negative integer or float, deciding the chosen probability for corresponding fitting net in training, if not set or invalid, the corresponding fitting net will not be used.

The training procedure will automatically choose single-task or multi-task mode, based on the above parameters. Note that parameters of single-task mode and multi-task mode can not be mixed.

An example input for training energy and dipole in water system can be found here: [multi-task input on water](#).

The supported descriptors for multi-task mode are listed:

- `se_a (se_e2_a)`
- `se_r (se_e2_r)`
- `se_at (se_e3)`
- `se_atten`
- `hybrid`

The supported fitting nets for multi-task mode are listed:

- `ener`
- `dipole`
- `polar`

The output of `dp freeze` command in multi-task mode can be seen in [freeze command](#).

5.5.2 Initialization from pretrained multi-task model

For advance training in multi-task mode, one can first train the descriptor on several upstream datasets and then transfer it on new downstream ones with newly added fitting nets. At the second step, you can also inherit some fitting nets trained on upstream datasets, by merely adding fitting net keys in [fitting_net_dict](#) and optional fitting net weights in [fitting_weight](#).

Take multi-task input on water again for example. You can first train a multi-task model using input script with the following [model](#) part:

```
"model": {
  "type_map": ["O", "H"],
  "descriptor": {
    "type": "se_e2_a",
    "sel": [46, 92],
    "rcut_smth": 0.5,
    "rcut": 6.0,
    "neuron": [25, 50, 100],
  },
  "fitting_net_dict": {
    "water_dipole": {
      "type": "dipole",
      "neuron": [100, 100, 100],
    },
    "water_ener": {
      "neuron": [240, 240, 240],
      "resnet_dt": true,
    }
  }
},
}
```

After training, you can freeze this multi-task model into one unit graph:

```
$ dp freeze -o graph.pb --united-model
```

Then if you want to transfer the trained descriptor and some fitting nets (take `water_ener` for example) to newly added datasets with new fitting net `water_ener_2`, you can modify the `model` part of the new input script in a more simplified way:

```
"model": {
  "type_map": ["O", "H"],
  "descriptor": {},
  "fitting_net_dict": {
    "water_ener": {},
    "water_ener_2": {
      "neuron": [240, 240, 240],
      "resnet_dt": true,
    }
  },
}
```

It will autocomplete the configurations according to the frozen graph.

Note that for newly added fitting net keys, other parts in the input script, including `data_dict` and `loss_dict` (optionally `fitting_weight`), should be set explicitly. While for old fitting net keys, it will inherit the old configurations if not set.

Finally, you can perform the modified multi-task training from the frozen model with command:

```
$ dp train input.json --init_frz_model graph.pb
```

5.5.3 Share layers among energy fitting networks

The multi-task training can be used to train multiple levels of energies (e.g. DFT and CCSD(T)) at the same time. In this situation, one can set `model/fitting_net[ener]/layer_name>` to share some of layers among fitting networks. The architecture of the layers with the same name should be the same.

For example, if one want to share the first and the third layers for two three-hidden-layer fitting networks, the following parameters should be set.

```
"fitting_net_dict": {
  "ccsd": {
    "neuron": [
      240,
      240,
      240
    ],
    "layer_name": ["l0", null, "l2", null]
  },
  "wb97m": {
    "neuron": [
      240,
      240,
      240
    ],
    "layer_name": ["l0", null, "l2", null]
  }
}
```

5.6 TensorBoard Usage

TensorBoard provides the visualization and tooling needed for machine learning experimentation. Full instructions for TensorBoard can be found [here](#).

5.6.1 Highlighted features

DeePMD-kit can now use most of the interesting features enabled by TensorBoard!

- Tracking and visualizing metrics, such as `l2_loss`, `l2_energy_loss` and `l2_force_loss`
- Visualizing the model graph (ops and layers)
- Viewing histograms of weights, biases, or other tensors as they change over time.
- Viewing summaries of trainable variables

5.6.2 How to use Tensorboard with DeePMD-kit

Before running TensorBoard, make sure you have generated summary data in a log directory by modifying the input script, setting `tensorboard` to true in the training subsection will enable the TensorBoard data analysis. eg. `water_se_a.json`.

```
"training" : {
  "systems":      ["../data/"],
  "set_prefix":   "set",
  "stop_batch":   1000000,
  "batch_size":   1,

  "seed":         1,

  "_comment": " display and restart",
  "_comment": " frequencies counted in batch",
  "disp_file":    "lcurve.out",
  "disp_freq":    100,
  "numb_test":    10,
  "save_freq":    1000,
  "save_ckpt":    "model.ckpt",

  "disp_training":true,
  "time_training":true,
  "tensorboard":  true,
  "tensorboard_log_dir":"log",
  "tensorboard_freq": 1000,
  "profiling":    false,
  "profiling_file":"timeline.json",
  "_comment":    "that's all"
}
```

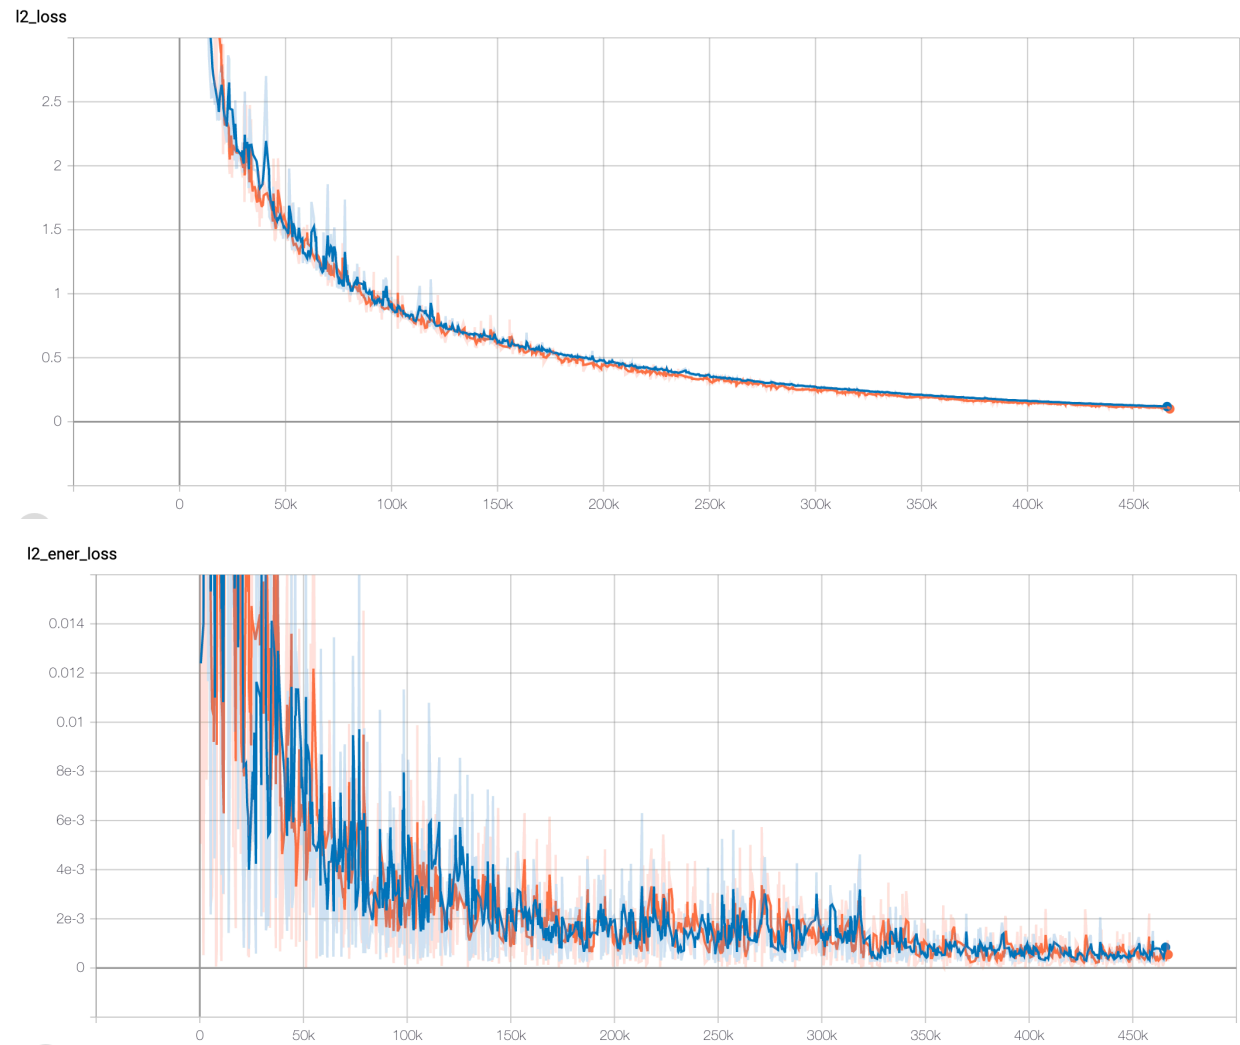

Once you have event files, run TensorBoard and provide the log directory. This should print that TensorBoard has started. Next, connect to `http://tensorboard_server_ip:6006`.

TensorBoard requires a logdir to read logs from. For info on configuring TensorBoard, run `TensorBoard -help`. One can easily change the log name with `"tensorboard_log_dir"` and the sampling frequency with `"tensorboard_freq"`.

```
tensorboard --logdir path/to/logs
```

Viewing summaries of trainable variables

5.6.4 Attention

Allowing the tensorboard analysis will take extra execution time.(eg, 15% increasing @Nvidia GTX 1080Ti double precision with default water sample)

TensorBoard can be used in Google Chrome or Firefox. Other browsers might work, but there may be bugs or performance issues.

5.7 Known limitations of using GPUs

If you use DeePMD-kit in a GPU environment, the acceptable value range of some variables is additionally restricted compared to the CPU environment due to the software's GPU implementations:

1. The number of atom types of a given system must be less than 128.
2. The maximum distance between an atom and its neighbors must be less than 128. It can be controlled by setting the rcut value of training parameters.

3. Theoretically, the maximum number of atoms that a single GPU can accept is about 10,000,000. However, this value is limited by the GPU memory size currently, usually within 1000,000 atoms even in the model compression mode.
4. The total sel value of training parameters(in `model/descriptor` section) must be less than 4096.
5. The size of the last layer of the embedding net must be less than 1024 during the model compression process.

5.8 Finetune the pretrained model

Pretraining-and-finetuning is a widely used approach in other fields such as Computer Vision (CV) or Natural Language Processing (NLP) to vastly reduce the training cost, while it's not trivial in potential models. Compositions and configurations of data samples or even computational parameters in upstream software (such as VASP) may be different between the pretrained and target datasets, leading to energy shifts or other diversities of training data.

Recently the emerging of methods such as [DPA-1](#) has brought us to a new stage where we can perform similar pretraining-finetuning approaches. DPA-1 can hopefully learn the common knowledge in the pretrained dataset (especially the `force` information) and thus reduce the computational cost in downstream training tasks. If you have a pretrained model `pretrained.pb` (here we support models using `se_atten` descriptor and `ener` fitting net) on a large dataset (for example, [OC2M](#) in [DPA-1 paper](#)), a finetuning strategy can be performed by simply running:

```
$ dp train input.json --finetune pretrained.pb
```

The command above will change the energy bias in the last layer of the fitting net in `pretrained.pb`, according to the training dataset in `input.json`.

Warning: Note that the elements in the training dataset must be contained in the pretrained dataset.

The finetune procedure will inherit the model structures in `pretrained.pb`, and thus it will ignore the model parameters in `input.json`, such as `descriptor`, `fitting_net`, `type_embedding` and `type_map`. However, you can still set the trainable parameters in each part of `input.json` to control the training procedure.

To obtain a more simplified script, for example, you can change the `model` part in `input.json` to perform finetuning:

```
{
  "model": {
    "type_map":      ["O", "H"],
    "type_embedding": {"trainable": true},
    "descriptor" : {},
    "fitting_net" : {}
  }
}
```

FREEZE AND COMPRESS

6.1 Freeze a model

The trained neural network is extracted from a checkpoint and dumped into a protobuf(.pb) file. This process is called “freezing” a model. The idea and part of our code are from [Morgan](#). To freeze a model, typically one does

```
$ dp freeze -o graph.pb
```

in the folder where the model is trained. The output model is called `graph.pb`.

In [multi-task mode](#):

- This process will in default output several models, each of which contains the common descriptor and one of the user-defined fitting nets in `fitting_net_dict`, let's name it `fitting_key`, together frozen in `graph_{fitting_key}.pb`. Those frozen models are exactly the same as single-task output with fitting net `fitting_key`.
- If you add `--united-model` option in this situation, the total multi-task model will be frozen into one unit `graph.pb`, which is mainly for multi-task initialization and can not be used directly for inference.

6.2 Compress a model

Once the frozen model is obtained from DeePMD-kit, we can get the neural network structure and its parameters (weights, biases, etc.) from the trained model, and compress it in the following way:

```
dp compress -i graph.pb -o graph-compress.pb
```

where `-i` gives the original frozen model, `-o` gives the compressed model. Several other command line options can be passed to `dp compress`, which can be checked with

```
$ dp compress --help
```

An explanation will be provided

```
usage: dp compress [-h] [-v {DEBUG,3,INFO,2,WARNING,1,ERROR,0}] [-l LOG_PATH]
                  [-m {master,collect,workers}] [-i INPUT] [-o OUTPUT]
                  [-s STEP] [-e EXTRAPOLATE] [-f FREQUENCY]
                  [-c CHECKPOINT_FOLDER]
```

optional arguments:

(continues on next page)

(continued from previous page)

```

-h, --help          show this help message and exit
-v {DEBUG,3,INFO,2,WARNING,1,ERROR,0}, --log-level {DEBUG,3,INFO,2,WARNING,1,ERROR,0}
                    set verbosity level by string or number, 0=ERROR,
                    1=WARNING, 2=INFO and 3=DEBUG (default: INFO)
-l LOG_PATH, --log-path LOG_PATH
                    set log file to log messages to disk, if not
                    specified, the logs will only be output to console
                    (default: None)
-m {master,collect,workers}, --mpi-log {master,collect,workers}
                    Set the manner of logging when running with MPI.
                    'master' logs only on main process, 'collect'
                    broadcasts logs from workers to master and 'workers'
                    means each process will output its own log (default:
                    master)
-i INPUT, --input INPUT
                    The original frozen model, which will be compressed by
                    the code (default: frozen_model.pb)
-o OUTPUT, --output OUTPUT
                    The compressed model (default:
                    frozen_model_compressed.pb)
-s STEP, --step STEP Model compression uses fifth-order polynomials to
                    interpolate the embedding-net. It introduces two
                    tables with different step size to store the
                    parameters of the polynomials. The first table covers
                    the range of the training data, while the second table
                    is an extrapolation of the training data. The domain
                    of each table is uniformly divided by a given step
                    size. And the step(parameter) denotes the step size of
                    the first table and the second table will use 10 *
                    step as it's step size to save the memory. Usually the
                    value ranges from 0.1 to 0.001. Smaller step means
                    higher accuracy and bigger model size (default: 0.01)
-e EXTRAPOLATE, --extrapolate EXTRAPOLATE
                    The domain range of the first table is automatically
                    detected by the code: [d_low, d_up]. While the second
                    table ranges from the first table's upper
                    boundary(d_up) to the extrapolate(parameter) * d_up:
                    [d_up, extrapolate * d_up] (default: 5)
-f FREQUENCY, --frequency FREQUENCY
                    The frequency of tabulation overflow check(Whether the
                    input environment matrix overflow the first or second
                    table range). By default do not check the overflow
                    (default: -1)
-c CHECKPOINT_FOLDER, --checkpoint-folder CHECKPOINT_FOLDER
                    path to checkpoint folder (default: .)
-t TRAINING_SCRIPT, --training-script TRAINING_SCRIPT
                    The training script of the input frozen model
                    (default: None)

```

Parameter explanation

Model compression, which includes tabulating the embedding net. The table is composed of fifth-order polynomial coefficients and is assembled from two sub-tables. For model descriptor with `se_e2_a` type, the first sub-table takes the `stride(parameter)` as its uniform stride, while the second sub-table takes `10 * stride` as its uniform stride; For model descriptor with `se_e3` type, the first sub-table takes `10 * stride` as its uniform stride, while the second sub-table takes `100 * stride` as its uniform stride. The range of the first table is automatically detected by DeePMD-kit, while the second table ranges from the first table's upper boundary(upper) to

the `extrapolate(parameter) * upper`. Finally, we added a check frequency parameter. It indicates how often the program checks for overflow(if the input environment matrix overflows the first or second table range) during the MD inference.

Justification of model compression

Model compression, with little loss of accuracy, can greatly speed up MD inference time. According to different simulation systems and training parameters, the speedup can reach more than 10 times at both CPU and GPU devices. At the same time, model compression can greatly change memory usage, reducing as much as 20 times under the same hardware conditions.

Acceptable original model version

The model compression interface requires the version of DeePMD-kit used in the original model generation should be `2.0.0-alpha.0` or above. If one has a frozen 1.2 or 1.3 model, one can upgrade it through the `dp convert-from` interface. (eg: `dp convert-from 1.2/1.3 -i old_frozen_model.pb -o new_frozen_model.pb`)

Acceptable descriptor type

Descriptors with `se_e2_a`, `se_e3`, and `se_e2_r` types are supported by the model compression feature. Hybrid mixed with the above descriptors is also supported.

Available activation functions for descriptor:

- `tanh`
- `gelu`
- `relu`
- `relu6`
- `softplus`
- `sigmoid`

TEST

7.1 Test a model

The frozen model can be used in many ways. The most straightforward test can be performed using `dp test`. A typical usage of `dp test` is

```
dp test -m graph.pb -s /path/to/system -n 30
```

where `-m` gives the tested model, `-s` the path to the tested system and `-n` the number of tested frames. Several other command line options can be passed to `dp test`, which can be checked with

```
$ dp test --help
```

An explanation will be provided

```
usage: dp test [-h] [-m MODEL] [-s SYSTEM] [-S SET_PREFIX] [-n NUMB_TEST]
              [-r RAND_SEED] [--shuffle-test] [-d DETAIL_FILE]

optional arguments:
  -h, --help                show this help message and exit
  -m MODEL, --model MODEL    Frozen model file to import
  -s SYSTEM, --system SYSTEM The system dir
  -S SET_PREFIX, --set-prefix SET_PREFIX The set prefix
  -n NUMB_TEST, --numb-test NUMB_TEST The number of data for test
  -r RAND_SEED, --rand-seed RAND_SEED The random seed
  --shuffle-test             Shuffle test data
  -d DETAIL_FILE, --detail-file DETAIL_FILE
                             The prefix to files where details of energy, force and virial accuracy/
                             accuracy per atom will be written
  -a, --atomic               Test the accuracy of atomic label, i.e. energy / tensor (dipole, polar)
```

7.2 Calculate Model Deviation

One can also use a subcommand to calculate the deviation of predicted forces or virials for a bunch of models in the following way:

```
dp model-devi -m graph.000.pb graph.001.pb graph.002.pb graph.003.pb -s ./data -o model_devi.out
```

where `-m` specifies graph files to be calculated, `-s` gives the data to be evaluated, `-o` the file to which model deviation results is dumped. Here is more information on this sub-command:

```
usage: dp model-devi [-h] [-v {DEBUG,3,INFO,2,WARNING,1,ERROR,0}]
                    [-l LOG_PATH] [-m MODELS [MODELS ...]] [-s SYSTEM]
                    [-S SET_PREFIX] [-o OUTPUT] [-f FREQUENCY] [-i ITEMS]

optional arguments:
  -h, --help                show this help message and exit
  -v {DEBUG,3,INFO,2,WARNING,1,ERROR,0}, --log-level {DEBUG,3,INFO,2,WARNING,1,ERROR,0}
                          set verbosity level by string or number, 0=ERROR,
                          1=WARNING, 2=INFO and 3=DEBUG (default: INFO)
  -l LOG_PATH, --log-path LOG_PATH
                          set log file to log messages to disk, if not
                          specified, the logs will only be output to console
                          (default: None)
  -m MODELS [MODELS ...], --models MODELS [MODELS ...]
                          Frozen models file to import (default:
                          ['graph.000.pb', 'graph.001.pb', 'graph.002.pb',
                          'graph.003.pb'])
  -s SYSTEM, --system SYSTEM
                          The system directory, not support recursive detection.
                          (default: .)
  -S SET_PREFIX, --set-prefix SET_PREFIX
                          The set prefix (default: set)
  -o OUTPUT, --output OUTPUT
                          The output file for results of model deviation
                          (default: model_devi.out)
  -f FREQUENCY, --frequency FREQUENCY
                          The trajectory frequency of the system (default: 1)
```

For more details concerning the definition of model deviation and its application, please refer to Yuzhi Zhang, Haidi Wang, Weijie Chen, Jinzhe Zeng, Linfeng Zhang, Han Wang, and Weinan E, DP-GEN: A concurrent learning platform for the generation of reliable deep learning based potential energy models, *Computer Physics Communications*, 2020, 253, 107206.

INFERENCE

Note that the model for inference is required to be compatible with the DeePMD-kit package. See [Model compatibility](#) for details.

8.1 Python interface

One may use the python interface of DeePMD-kit for model inference, an example is given as follows

```
from deepmd.infer import DeepPot
import numpy as np

dp = DeepPot("graph.pb")
coord = np.array([[1, 0, 0], [0, 0, 1.5], [1, 0, 3]]).reshape([1, -1])
cell = np.diag(10 * np.ones(3)).reshape([1, -1])
atype = [1, 0, 1]
e, f, v = dp.eval(coord, cell, atype)
```

where e , f and v are predicted energy, force and virial of the system, respectively.

Furthermore, one can use the python interface to calculate model deviation.

```
from deepmd.infer import calc_model_devi
from deepmd.infer import DeepPot as DP
import numpy as np

coord = np.array([[1, 0, 0], [0, 0, 1.5], [1, 0, 3]]).reshape([1, -1])
cell = np.diag(10 * np.ones(3)).reshape([1, -1])
atype = [1, 0, 1]
graphs = [DP("graph.000.pb"), DP("graph.001.pb")]
model_devi = calc_model_devi(coord, cell, atype, graphs)
```

Note that if the model inference or model deviation is performed cyclically, one should avoid calling the same model multiple times. Otherwise, tensorflow will never release the memory and this may lead to an out-of-memory (OOM) error.

8.2 C/C++ interface

8.2.1 C++ interface

The C++ interface of DeePMD-kit is also available for the model interface, which is considered faster than the Python interface. An example `infer_water.cpp` is given below:

```
#include "deepmd/DeepPot.h"

int main(){
    deepmd::DeepPot dp ("graph.pb");
    std::vector<double> coord = {1., 0., 0., 0., 0., 1.5, 1., 0., 3.};
    std::vector<double> cell = {10., 0., 0., 0., 10., 0., 0., 0., 10.};
    std::vector<int> atype = {1, 0, 1};
    double e;
    std::vector<double> f, v;
    dp.compute (e, f, v, coord, atype, cell);
}
```

where `e`, `f` and `v` are predicted energy, force and virial of the system, respectively. See `deepmd::DeepPot` for details.

You can compile `infer_water.cpp` using `gcc`:

```
gcc infer_water.cpp -L $deepmd_root/lib -L $tensorflow_root/lib -I $deepmd_root/include -Wl,--no-as-needed -ldeepmd_cc -lstdc++ -ltensorflow_cc -Wl,-rpath=$deepmd_root/lib -Wl,-rpath=$tensorflow_root/lib -o infer_water
```

and then run the program:

```
./infer_water
```

8.2.2 C interface

Although C is harder to write, the C library will not be affected by different versions of C++ compilers.

An example `infer_water.c` is given below:

```
#include <stdio.h>
#include <stdlib.h>
#include "deepmd/c_api.h"

int main(){
    const char* model = "graph.pb";
    double coord[] = {1., 0., 0., 0., 0., 1.5, 1., 0., 3.};
    double cell[] = {10., 0., 0., 0., 10., 0., 0., 0., 10.};
    int atype[] = {1, 0, 1};
    // init C pointers with given memory
    double* e = malloc(sizeof(*e));
    double* f = malloc(sizeof(*f) * 9); // natoms * 3
    double* v = malloc(sizeof(*v) * 9);
    double* ae = malloc(sizeof(*ae) * 9); // natoms
    double* av = malloc(sizeof(*av) * 27); // natoms * 9
    // DP model
    DP_DeepPot* dp = DP_NewDeepPot(model);
```

(continues on next page)

(continued from previous page)

```

DP_DeepPotCompute (dp, 3, coord, atype, cell, e, f, v, ae, av);
// print results
printf("energy: %f\n", *e);
for (int ii = 0; ii < 9; ++ii)
    printf("force[%d]: %f\n", ii, f[ii]);
for (int ii = 0; ii < 9; ++ii)
    printf("force[%d]: %f\n", ii, v[ii]);
// free memory
free(e);
free(f);
free(v);
free(ae);
free(av);
free(dp);
}

```

where *e*, *f* and *v* are predicted energy, force and virial of the system, respectively. *ae* and *av* are atomic energy and atomic virials, respectively. See `DP_DeepPotCompute()` for details.

You can compile `infer_water.c` using `gcc`:

```

gcc infer_water.c -L $deepmd_root/lib -L $tensorflow_root/lib -I $deepmd_root/include -Wl,--no-as-
needed -ldeepmd_c -Wl,-rpath=$deepmd_root/lib -Wl,-rpath=$tensorflow_root/lib -o infer_water

```

and then run the program:

```
./infer_water
```

8.2.3 Header-only C++ library interface (recommended)

The header-only C++ library is built based on the C library. Thus, it has the same ABI compatibility as the C library but provides a powerful C++ interface. To use it, include `deepmd/deepmd.hpp`.

```

#include "deepmd/deepmd.hpp"

int main(){
    deepmd::hpp::DeepPot dp ("graph.pb");
    std::vector<double> coord = {1., 0., 0., 0., 0., 1.5, 1., 0., 3.};
    std::vector<double> cell = {10., 0., 0., 0., 10., 0., 0., 0., 10.};
    std::vector<int> atype = {1, 0, 1};
    double e;
    std::vector<double> f, v;
    dp.compute (e, f, v, coord, atype, cell);
}

```

Note that the feature of the header-only C++ library is still limited compared to the original C++ library. See `deepmd::hpp::DeepPot` for details.

You can compile `infer_water_hpp.cpp` using `gcc`:

```

gcc infer_water_hpp.hpp -L $deepmd_root/lib -L $tensorflow_root/lib -I $deepmd_root/include -Wl,--
no-as-needed -ldeepmd_c -Wl,-rpath=$deepmd_root/lib -Wl,-rpath=$tensorflow_root/lib -o infer_
water_hpp

```

and then run the program:

```
./infer_water_hpp
```

In some cases, one may want to pass the custom neighbor list instead of the native neighbor list. The above code can be revised as follows:

```
// neighbor list
std::vector<std::vector<int>> nlist_vec = {
    {1, 2},
    {0, 2},
    {0, 1}
};
std::vector<int> ilist(3), numneigh(3);
std::vector<int*> firstneigh(3);
InputNlist nlist(3, &ilist[0], &numneigh[0], &firstneigh[0]);
convert_nlist(nlist, nlist_vec);
dp.compute (e, f, v, coord, atype, cell, 0, nlist, 0);
```

Here, `nlist_vec` means the neighbors of atom 0 are atom 1 and atom 2, the neighbors of atom 1 are atom 0 and atom 2, and the neighbors of atom 2 are atom 0 and atom 1.

COMMAND LINE INTERFACE

DeePMD-kit: A deep learning package for many-body potential energy representation and molecular dynamics

```
usage: dp [-h] [--version]
          {config,transfer,train,freeze,test,compress,doc-train-input,model-devi,convert-from,
↪ neighbor-stat,train-nvnmd}
          ...
```

9.1 Named Arguments

<code>--version</code>	show program's version number and exit
------------------------	--

9.2 Valid subcommands

<code>command</code>	Possible choices: config, transfer, train, freeze, test, compress, doc-train-input, model-devi, convert-from, neighbor-stat, train-nvnmd
----------------------	--

9.3 Sub-commands

9.3.1 config

fast configuration of parameter file for smooth model

```
dp config [-h] [-v {DEBUG,3,INFO,2,WARNING,1,ERROR,0}] [-l LOG_PATH]
          [-o OUTPUT]
```

Named Arguments

<code>-v, --log-level</code>	<p>Possible choices: DEBUG, 3, INFO, 2, WARNING, 1, ERROR, 0</p> <p>set verbosity level by string or number, 0=ERROR, 1=WARNING, 2=INFO and 3=DEBUG</p> <p>Default: “INFO”</p>
<code>-l, --log-path</code>	<p>set log file to log messages to disk, if not specified, the logs will only be output to console</p>
<code>-o, --output</code>	<p>the output json file</p> <p>Default: “input.json”</p>

9.3.2 transfer

pass parameters to another model

```
dp transfer [-h] [-v {DEBUG,3,INFO,2,WARNING,1,ERROR,0}] [-l LOG_PATH]
           [-r RAW_MODEL] [-O OLD_MODEL] [-o OUTPUT]
```

Named Arguments

<code>-v, --log-level</code>	<p>Possible choices: DEBUG, 3, INFO, 2, WARNING, 1, ERROR, 0</p> <p>set verbosity level by string or number, 0=ERROR, 1=WARNING, 2=INFO and 3=DEBUG</p> <p>Default: “INFO”</p>
<code>-l, --log-path</code>	<p>set log file to log messages to disk, if not specified, the logs will only be output to console</p>
<code>-r, --raw-model</code>	<p>the model receiving parameters</p> <p>Default: “raw_frozen_model.pb”</p>
<code>-O, --old-model</code>	<p>the model providing parameters</p> <p>Default: “old_frozen_model.pb”</p>
<code>-o, --output</code>	<p>the model after passing parameters</p> <p>Default: “frozen_model.pb”</p>

9.3.3 train

train a model

```
dp train [-h] [-v {DEBUG,3,INFO,2,WARNING,1,ERROR,0}] [-l LOG_PATH]
         [-m {master,collect,workers}]
         [-i INIT_MODEL | -r RESTART | -f INIT_FRZ_MODEL | -t FINETUNE]
         [-o OUTPUT] [--skip-neighbor-stat]
         INPUT
```

Positional Arguments

INPUT the input parameter file in json or yaml format

Named Arguments

-v, --log-level Possible choices: DEBUG, 3, INFO, 2, WARNING, 1, ERROR, 0
 set verbosity level by string or number, 0=ERROR, 1=WARNING, 2=INFO and 3=DEBUG
 Default: "INFO"

-l, --log-path set log file to log messages to disk, if not specified, the logs will only be output to console

-m, --mpi-log Possible choices: master, collect, workers
 Set the manner of logging when running with MPI. 'master' logs only on main process, 'collect' broadcasts logs from workers to master and 'workers' means each process will output its own log
 Default: "master"

-i, --init-model Initialize the model by the provided checkpoint.

-r, --restart Restart the training from the provided checkpoint.

-f, --init-frz-model Initialize the training from the frozen model.

-t, --finetune Finetune the frozen pretrained model.

-o, --output The output file of the parameters used in training.
 Default: "out.json"

--skip-neighbor-stat Skip calculating neighbor statistics. Sel checking, automatic sel, and model compression will be disabled.
 Default: False

examples:

```
dp train input.json dp train input.json --restart model.ckpt dp train input.json --init-model model.ckpt
```

9.3.4 freeze

freeze the model

```
dp freeze [-h] [-v {DEBUG,3,INFO,2,WARNING,1,ERROR,0}] [-l LOG_PATH]
          [-c CHECKPOINT_FOLDER] [-o OUTPUT] [-n NODE_NAMES] [-w NVNMD_WEIGHT]
          [--united-model]
```

Named Arguments

- v, --log-level Possible choices: DEBUG, 3, INFO, 2, WARNING, 1, ERROR, 0
 set verbosity level by string or number, 0=ERROR, 1=WARNING,
 2=INFO and 3=DEBUG
 Default: "INFO"
- l, --log-path set log file to log messages to disk, if not specified, the logs will only be
 output to console
- c, --checkpoint-folder path to checkpoint folder
 Default: "."
- o, --output name of graph, will output to the checkpoint folder
 Default: "frozen_model.pb"
- n, --node-names the frozen nodes, if not set, determined from the model type
- w, --nvnmd-weight the name of weight file (.npy), if set, save the model's weight into the file
- united-model When in multi-task mode, freeze all nodes into one united model
 Default: False

examples:

dp freeze dp freeze -o graph.pb

9.3.5 test

test the model

```
dp test [-h] [-v {DEBUG,3,INFO,2,WARNING,1,ERROR,0}] [-l LOG_PATH] [-m MODEL]
        [-s SYSTEM | -f DATAFILE] [-S SET_PREFIX] [-n NUMB_TEST]
        [-r RAND_SEED] [--shuffle-test] [-d DETAIL_FILE] [-a]
```

Named Arguments

- v, --log-level Possible choices: DEBUG, 3, INFO, 2, WARNING, 1, ERROR, 0
 set verbosity level by string or number, 0=ERROR, 1=WARNING,
 2=INFO and 3=DEBUG
 Default: "INFO"
- l, --log-path set log file to log messages to disk, if not specified, the logs will only be
 output to console
- m, --model Frozen model file to import
 Default: "frozen_model.pb"
- s, --system The system dir. Recursively detect systems in this directory
 Default: "."
- f, --datafile The path to file of test list.

-S, --set-prefix	The set prefix Default: "set"
-n, --numb-test	The number of data for test Default: 100
-r, --rand-seed	The random seed
--shuffle-test	Shuffle test data Default: False
-d, --detail-file	The prefix to files where details of energy, force and virial accuracy/accuracy per atom will be written
-a, --atomic	Test the accuracy of atomic label, i.e. energy / tensor (dipole, polar) Default: False

examples:

```
dp test -m graph.pb -s /path/to/system -n 30
```

9.3.6 compress

compress a model

```
dp compress [-h] [-v {DEBUG,3,INFO,2,WARNING,1,ERROR,0}] [-l LOG_PATH]
            [-m {master,collect,workers}] [-i INPUT] [-o OUTPUT] [-s STEP]
            [-e EXTRAPOLATE] [-f FREQUENCY] [-c CHECKPOINT_FOLDER]
            [-t TRAINING_SCRIPT]
```

Named Arguments

-v, --log-level	Possible choices: DEBUG, 3, INFO, 2, WARNING, 1, ERROR, 0 set verbosity level by string or number, 0=ERROR, 1=WARNING, 2=INFO and 3=DEBUG Default: "INFO"
-l, --log-path	set log file to log messages to disk, if not specified, the logs will only be output to console
-m, --mpi-log	Possible choices: master, collect, workers Set the manner of logging when running with MPI. 'master' logs only on main process, 'collect' broadcasts logs from workers to master and 'workers' means each process will output its own log Default: "master"
-i, --input	The original frozen model, which will be compressed by the code Default: "frozen_model.pb"
-o, --output	The compressed model Default: "frozen_model_compressed.pb"

- `-s, --step` Model compression uses fifth-order polynomials to interpolate the embedding-net. It introduces two tables with different step size to store the parameters of the polynomials. The first table covers the range of the training data, while the second table is an extrapolation of the training data. The domain of each table is uniformly divided by a given step size. And the `step(parameter)` denotes the step size of the first table and the second table will use $10 * \text{step}$ as its step size to save the memory. Usually the value ranges from 0.1 to 0.001. Smaller step means higher accuracy and bigger model size
Default: 0.01
- `-e, --extrapolate` The domain range of the first table is automatically detected by the code: `[d_low, d_up]`. While the second table ranges from the first table's upper boundary(`d_up`) to the `extrapolate(parameter) * d_up`: `[d_up, extrapolate * d_up]`
Default: 5
- `-f, --frequency` The frequency of tabulation overflow check(Whether the input environment matrix overflow the first or second table range). By default do not check the overflow
Default: -1
- `-c, --checkpoint-folder` path to checkpoint folder
Default: "model-compression"
- `-t, --training-script` The training script of the input frozen model

examples:

`dp compress dp compress -i graph.pb -o compressed.pb`

9.3.7 doc-train-input

print the documentation (in rst format) of input training parameters.

```
dp doc-train-input [-h] [-v {DEBUG,3,INFO,2,WARNING,1,ERROR,0}] [-l LOG_PATH]
                  [--out-type OUT_TYPE]
```

Named Arguments

- `-v, --log-level` Possible choices: DEBUG, 3, INFO, 2, WARNING, 1, ERROR, 0
set verbosity level by string or number, 0=ERROR, 1=WARNING, 2=INFO and 3=DEBUG
Default: "INFO"
- `-l, --log-path` set log file to log messages to disk, if not specified, the logs will only be output to console
- `--out-type` The output type
Default: "rst"

9.3.8 model-devi

calculate model deviation

```
dp model-devi [-h] [-v {DEBUG,3,INFO,2,WARNING,1,ERROR,0}] [-l LOG_PATH]
               [-m MODELS [MODELS ...]] [-s SYSTEM] [-S SET_PREFIX] [-o OUTPUT]
               [-f FREQUENCY]
```

Named Arguments

-v, --log-level	Possible choices: DEBUG, 3, INFO, 2, WARNING, 1, ERROR, 0 set verbosity level by string or number, 0=ERROR, 1=WARNING, 2=INFO and 3=DEBUG Default: "INFO"
-l, --log-path	set log file to log messages to disk, if not specified, the logs will only be output to console
-m, --models	Frozen models file to import Default: ['graph.000.pb', 'graph.001.pb', 'graph.002.pb', 'graph.003.pb']
-s, --system	The system directory. Recursively detect systems in this directory. Default: "."
-S, --set-prefix	The set prefix Default: "set"
-o, --output	The output file for results of model deviation Default: "model_devi.out"
-f, --frequency	The trajectory frequency of the system Default: 1

examples:

```
dp model-devi -m graph.000.pb graph.001.pb graph.002.pb graph.003.pb -s ./data -o model_devi.out
```

9.3.9 convert-from

convert lower model version to supported version

```
dp convert-from [-h] [-v {DEBUG,3,INFO,2,WARNING,1,ERROR,0}] [-l LOG_PATH]
                [-i INPUT_MODEL] [-o OUTPUT_MODEL]
                [{auto,0.12,1.0,1.1,1.2,1.3,2.0,pbtxt}]
```

Positional Arguments

FROM Possible choices: auto, 0.12, 1.0, 1.1, 1.2, 1.3, 2.0, pbtxt
The original model compatibility
Default: “auto”

Named Arguments

-v, --log-level Possible choices: DEBUG, 3, INFO, 2, WARNING, 1, ERROR, 0
set verbosity level by string or number, 0=ERROR, 1=WARNING,
2=INFO and 3=DEBUG
Default: “INFO”
-l, --log-path set log file to log messages to disk, if not specified, the logs will only be
output to console
-i, --input-model the input model
Default: “frozen_model.pb”
-o, --output-model the output model
Default: “convert_out.pb”

examples:

```
dp convert-from -i graph.pb -o graph_new.pb dp convert-from auto -i graph.pb -o graph_new.pb dp  
convert-from 1.0 -i graph.pb -o graph_new.pb
```

9.3.10 neighbor-stat

Calculate neighbor statistics

```
dp neighbor-stat [-h] [-v {DEBUG,3,INFO,2,WARNING,1,ERROR,0}] [-l LOG_PATH]  
                 [-s SYSTEM] -r RCUT -t TYPE_MAP [TYPE_MAP ...] [--one-type]
```

Named Arguments

-v, --log-level Possible choices: DEBUG, 3, INFO, 2, WARNING, 1, ERROR, 0
set verbosity level by string or number, 0=ERROR, 1=WARNING,
2=INFO and 3=DEBUG
Default: “INFO”
-l, --log-path set log file to log messages to disk, if not specified, the logs will only be
output to console
-s, --system The system dir. Recursively detect systems in this directory
Default: “.”
-r, --rcut cutoff radius
-t, --type-map type map

`--one-type` treat all types as a single type. Used with `se_atten` descriptor.
Default: False

examples:

`dp neighbor-stat -s data -r 6.0 -t O H`

9.3.11 train-nvnmd

train nvnmd model

```
dp train-nvnmd [-h] [-v {DEBUG,3,INFO,2,WARNING,1,ERROR,0}] [-l LOG_PATH]
                [-r RESTART] [-s {s1,s2}]
                INPUT
```

Positional Arguments

INPUT the input parameter file in json format

Named Arguments

`-v, --log-level` Possible choices: DEBUG, 3, INFO, 2, WARNING, 1, ERROR, 0
set verbosity level by string or number, 0=ERROR, 1=WARNING, 2=INFO and 3=DEBUG
Default: "INFO"

`-l, --log-path` set log file to log messages to disk, if not specified, the logs will only be output to console

`-r, --restart` Restart the training from the provided checkpoint.

`-s, --step` Possible choices: s1, s2
steps to train model of NVNMD: s1 (train CNN), s2 (train QNN)
Default: "s1"

INTEGRATE WITH THIRD-PARTY PACKAGES

Note that the model for inference is required to be compatible with the DeePMD-kit package. See [Model compatibility](#) for details.

10.1 Use deep potential with ASE

Deep potential can be set up as a calculator with ASE to obtain potential energies and forces.

```
from ase import Atoms
from deepmd.calculator import DP

water = Atoms(
    "H2O",
    positions=[(0.7601, 1.9270, 1), (1.9575, 1, 1), (1.0, 1.0, 1.0)],
    cell=[100, 100, 100],
    calculator=DP(model="frozen_model.pb"),
)
print(water.get_potential_energy())
print(water.get_forces())
```

Optimization is also available:

```
from ase.optimize import BFGS

dyn = BFGS(water)
dyn.run(fmax=1e-6)
print(water.get_positions())
```

10.2 Run MD with LAMMPS

Running an MD simulation with LAMMPS is simpler. In the LAMMPS input file, one needs to specify the pair style as follows

```
pair_style      deepmd graph.pb
pair_coeff      * * 0 H
```

where `graph.pb` is the file name of the frozen model. `pair_coeff` maps atom names (0 H) with LAMMPS atom types (integers from 1 to `Ntypes`, i.e. 1 2).

10.3 LAMMPS commands

10.3.1 Enable DeePMD-kit plugin (plugin mode)

If you are using the plugin mode, enable DeePMD-kit package in LAMMPS with `plugin` command:

```
plugin load libdeepmd_lmp.so
```

After LAMMPS version `patch_24Mar2022`, another way to load plugins is to set the environmental variable `LAMMPS_PLUGIN_PATH`:

```
LAMMPS_PLUGIN_PATH=$deepmd_root/lib/deepmd_lmp
```

where `$deepmd_root` is the directory to [install C++ interface](#).

The built-in mode doesn't need this step.

10.3.2 `pair_style deepmd`

The DeePMD-kit package provides the `pair_style deepmd`

```
pair_style deepmd models ... keyword value ...
```

- `deepmd` = style of this `pair_style`
- `models` = frozen model(s) to compute the interaction. If multiple models are provided, then only the first model serves to provide energy and force prediction for each timestep of molecular dynamics, and the model deviation will be computed among all models every `out_freq` timesteps.
- `keyword` = `out_file` or `out_freq` or `fparam` or `fparam_from_compute` or `atomic` or `relative` or `relative_v` or `aparam` or `ttm`

Examples

```
pair_style deepmd graph.pb
pair_style deepmd graph.pb fparam 1.2
pair_style deepmd graph_0.pb graph_1.pb graph_2.pb out_file md.out out_freq 10 atomic relative 1.0
pair_coeff * * O H

pair_style deepmd cp.pb fparam_from_compute TEMP
compute TEMP all temp
```

Description

Evaluate the interaction of the system by using [Deep Potential](#) or [Deep Potential Smooth Edition](#). It is noticed that deep potential is not a “pairwise” interaction, but a multi-body interaction.

This pair style takes the deep potential defined in a model file that usually has the `.pb` extension. The model can be trained and frozen by package [DeePMD-kit](#).

The model deviation evaluates the consistency of the force predictions from multiple models. By default, only the maximal, minimal and average model deviations are output. If the key `atomic` is set, then the model deviation of force prediction of each atom will be output.

By default, the model deviation is output in absolute value. If the keyword `relative` is set, then the relative model deviation of the force will be output, including values output by the keyword `atomic`. The relative model deviation of the force on atom i is defined by

$$E_{f_i} = \frac{|D_{f_i}|}{|f_i| + l}$$

where D_{f_i} is the absolute model deviation of the force on atom i , f_i is the norm of the force and l is provided as the parameter of the keyword `relative`. If the keyword `relative_v` is set, then the relative model deviation of the virial will be output instead of the absolute value, with the same definition of that of the force:

$$E_{v_i} = \frac{|D_{v_i}|}{|v_i| + l}$$

If the keyword `fparam` is set, the given frame parameter(s) will be fed to the model. If the keyword `fparam_from_compute` is set, the global parameter(s) from compute command (e.g., temperature from `compute temp command`) will be fed to the model as the frame parameter(s). If the keyword `aparam` is set, the given atomic parameter(s) will be fed to the model, where each atom is assumed to have the same atomic parameter(s). If the keyword `ttm` is set, electronic temperatures from `fix ttm command` will be fed to the model as the atomic parameters.

Only a single `pair_coeff` command is used with the deepmd style which specifies atom names. These are mapped to LAMMPS atom types (integers from 1 to `Ntypes`) by specifying `Ntypes` additional arguments after `*` in the `pair_coeff` command. If atom names are not set in the `pair_coeff` command, the training parameter `type_map` will be used by default. If the training parameter `type_map` is not set, atom names in the `pair_coeff` command cannot be set. In this case, atom type indexes in `type.raw` (integers from 0 to `Ntypes-1`) will map to LAMMPS atom types.

Restrictions

- The deepmd pair style is provided in the USER-DEEPMK package, which is compiled from the DeePMD-kit, visit the [DeePMD-kit website](#) for more information.

10.3.3 Compute tensorial properties

The DeePMD-kit package provides the compute `deeptensor/atom` for computing atomic tensorial properties.

```
compute ID group-ID deeptensor/atom model_file
```

- ID: user-assigned name of the computation
- group-ID: ID of the group of atoms to compute
- deeptensor/atom: the style of this compute
- model_file: the name of the binary model file.

At this time, the training parameter `type_map` will be mapped to LAMMPS atom types.

Examples

```
compute          dipole all deeptensor/atom dipole.pb
```

The result of the compute can be dumped to trajectory file by

```
dump            1 all custom 100 water.dump id type c_dipole[1] c_dipole[2] c_dipole[3]
```

Restrictions

- The `deeptensor/atom` compute is provided in the USER-DEEPMD package, which is compiled from the DeePMD-kit, visit the [DeePMD-kit website](#) for more information.

10.3.4 Long-range interaction

The reciprocal space part of the long-range interaction can be calculated by LAMMPS command `kspace_style`. To use it with DeePMD-kit, one writes

```
pair_style      deepmd graph.pb
pair_coeff      * *
kspace_style     pppm 1.0e-5
kspace_modify    gewald 0.45
```

Please notice that the DeePMD does nothing to the direct space part of the electrostatic interaction, because this part is assumed to be fitted in the DeePMD model (the direct space cut-off is thus the cut-off of the DeePMD model). The splitting parameter `gewald` is modified by the `kspace_modify` command.

10.3.5 Use of the centroid/stress/atom to get the full 3x3 “atomic-virial”

The DeePMD-kit allows also the computation of per-atom stress tensor defined as:

$$dv_{atom} = \sum_m (\mathbf{r}_n - \mathbf{r}_m) \frac{de_m}{d\mathbf{r}_n}$$

Where \mathbf{r}_n is the atomic position of n th atom, \mathbf{v}_n velocity of the atom and $\frac{de_m}{d\mathbf{r}_n}$ the derivative of the atomic energy.

In LAMMPS one can get the per-atom stress using the command `centroid/stress/atom`:

```
compute ID group-ID centroid/stress/atom NULL virial
```

see [LAMMPS doc page](#) for more details on the meaning of the keywords.

Examples

In order of computing the 9-component per-atom stress

```
compute stress all centroid/stress/atom NULL virial
```

Thus `c_stress` is an array with 9 components in the order `xx,yy,zz,xy,xz,yz,yx,zx,zy`.

If you use this feature please cite D. Tisi, L. Zhang, R. Bertossa, H. Wang, R. Car, S. Baroni - arXiv preprint arXiv:2108.10850, 2021

10.3.6 Computation of heat flux

Using a per-atom stress tensor one can, for example, compute the heat flux defined as:

$$\mathbf{J} = \sum_n e_n \mathbf{v}_n + \sum_{n,m} (\mathbf{r}_m - \mathbf{r}_n) \frac{de_m}{d\mathbf{r}_n} \mathbf{v}_n$$

to compute the heat flux with LAMMPS:

```
compute ke_ID all ke/atom
compute pe_ID all pe/atom
compute stress_ID group-ID centroid/stress/atom NULL virial
compute flux_ID all heat/flux ke_ID pe_ID stress_ID
```

Examples

```
compute ke all ke/atom
compute pe all pe/atom
compute stress all centroid/stress/atom NULL virial
compute flux all heat/flux ke pe stress
```

`c_flux` is a global vector of length 6. The first three components are the x , y and z components of the full heat flux vector. The others are the components of the so-called convective portion, see [LAMMPS doc page](#) for more details.

If you use these features please cite D. Tisi, L. Zhang, R. Bertossa, H. Wang, R. Car, S. Baroni - arXiv preprint arXiv:2108.10850, 2021

10.4 Run path-integral MD with i-PI

The i-PI works in a client-server model. The i-PI provides the server for integrating the replica positions of atoms, while the DeePMD-kit provides a client named `dp_ipi` (or `dp_ipi_low` for low precision) that computes the interactions (including energy, forces and virials). The server and client communicate via the Unix domain socket or the Internet socket. Installation instructions for i-PI can be found [here](#). The client can be started by

```
i-pi input.xml &
dp_ipi water.json
```

It is noted that multiple instances of the client allow for computing, in parallel, the interactions of multiple replicas of the path-integral MD.

`water.json` is the parameter file for the client `dp_ipi`, and an example is provided:

```
{
  "verbose":          false,
  "use_unix":          true,
  "port":              31415,
  "host":              "localhost",
  "graph_file":        "graph.pb",
  "coord_file":         "conf.xyz",
  "atom_type" : {
    "OW":              0,
    "HW1":              1,
    "HW2":              1
  }
}
```

The option `use_unix` is set to `true` to activate the Unix domain socket, otherwise, the Internet socket is used.

The option `port` should be the same as that in `input.xml`:

```
<port>31415</port>
```

The option `graph_file` provides the file name of the frozen model.

The `dp_ipi` gets the atom names from an `XYZ` file provided by `coord_file` (meanwhile ignores all coordinates in it) and translates the names to atom types by rules provided by `atom_type`.

10.5 Running MD with GROMACS

10.5.1 DP/MM Simulation

This part gives a simple tutorial on how to run a DP/MM simulation for methane in water, which means using DP for methane and TIP3P for water. All relevant files can be found in `examples/methane`.

Topology Preparation

Similar to QM/MM simulation, the internal interactions (including bond, angle, dihedrals, LJ, Columb) of the region described by a neural network potential (NNP) have to be turned off. In GROMACS, bonded interactions can be turned off by modifying `[bonds]`, `[angles]`, `[dihedrals]` and `[pairs]` sections. And LJ and Columb interactions must be turned off by `[exclusions]` section.

For example, if one wants to simulate ethane in water, using DeepPotential for methane and TIP3P for water, the topology of methane should be like the following (as presented in `examples/methane/methane.itp`):

```
[ atomtypes ]
;name btype  mass  charge ptype    sigma  epsilon
c3    c3    0.0    0.0    A  0.339771 0.451035
hc    hc    0.0    0.0    A  0.260018 0.087027

[ moleculetype ]
;name                nrexcl
```

(continues on next page)

(continued from previous page)

```

methane          3

[ atoms ]
; nr type  resnr residue atom  cgnr  charge  mass
  1  c3    1    MOL   C1    1 -0.1068 12.010
  2  hc    1    MOL   H1    2  0.0267  1.008
  3  hc    1    MOL   H2    3  0.0267  1.008
  4  hc    1    MOL   H3    4  0.0267  1.008
  5  hc    1    MOL   H4    5  0.0267  1.008

[ bonds ]
; i j  func  b0  kb
  1 2    5
  1 3    5
  1 4    5
  1 5    5

[ exclusions ]
; ai  aj1  aj2  aj3  aj4
  1   2   3   4   5
  2   1   3   4   5

4	1	5	1	1.0758e+02	3.2635e+02 ;	H3 - C1	- H4

DeepMD Settings

Before running simulations, we need to tell GROMACS to use DeepPotential by setting the environment variable `GMX_DEEPMD_INPUT_JSON`:

```
export GMX_DEEPMD_INPUT_JSON=input.json
```

Then, in your working directories, we have to write `input.json` file:

```
{
  "graph_file": "/path/to/graph.pb",
  "type_file": "type.raw",
  "index_file": "index.raw",
  "lambda": 1.0,
  "pbc": false
}
```

Here is an explanation for these settings:

- `graph_file`: The graph file (with suffix `.pb`) generated by `dp freeze` command
- `type_file`: File to specify DP atom types (in space-separated format). Here, `type.raw` looks like

```
1 0 0 0 0
```

- `index_file`: File containing indices of DP atoms (in space-separated format), which should be consistent with the indices' order in `.gro` file but starting from zero. Here, `index.raw` looks like

```
0 1 2 3 4
```

- `lambda`: Optional, default 1.0. Used in alchemical calculations.
- `pbc`: Optional, default true. If true, the GROMACS periodic condition is passed to DeepMD.

Run Simulation

Finally, you can run GROMACS using `gmx mdrun` as usual.

10.5.2 All-atom DP Simulation

This part gives an example of how to simulate all atoms described by a DeepPotential with Gromacs, taking water as an example. Instead of using [`exclusions`] to turn off the non-bonded energies, we can simply do this by setting LJ parameters (i.e. `epsilon` and `sigma`) and partial charges to 0, as shown in `examples/water/gmx/water.top`:

```
[ atomtypes ]
; name      at.num  mass    charge ptype  sigma      epsilon
HW          1      1.008  0.0000  A    0.00000e+00 0.00000e+00
OW          8      16.00  0.0000  A    0.00000e+00 0.00000e+00
```

As mentioned in the above section, `input.json` and relevant files (`index.raw`, `type.raw`) should also be created. Then, we can start the simulation under the NVT ensemble and plot the radial distribution function (RDF) by `gmx rdf` command. We can see that the RDF given by Gromacs+DP matches perfectly with Lammmps+DP, which further provides an evidence on the validity of our simulation.

However, we still recommend you run an all-atom DP simulation using LAMMPS since it is more stable and efficient.

10.6 Interfaces out of DeePMD-kit

The codes of the following interfaces are not a part of the DeePMD-kit package and maintained by other repositories. We list these interfaces here for user convenience.

10.6.1 dpdata

dpdata provides the `predict` method for `System` class:

```
import dpdata
dsys = dpdata.LabeledSystem('OUTCAR')
dp_sys = dsys.predict("frozen_model_compressed.pb")
```

By inferring with the DP model `frozen_model_compressed.pb`, dpdata will generate a new labeled system `dp_sys` with inferred energies, forces, and virials.

10.6.2 OpenMM plugin for DeePMD-kit

An [OpenMM](#) plugin is provided from [JingHuangLab/openmm_deepmd_plugin](#), written by the [Huang Lab](#) at Westlake University.

10.6.3 AMBER interface to DeePMD-kit

An [AMBER](#) interface to DeePMD-kit is written by the [\[York Lab\]](#) from Rutgers University. It is open-source at [GitLab RutgersLBSR/AmberDPRc](#). Details can be found in [this paper](#).

10.6.4 DP-GEN

DP-GEN provides a workflow to generate accurate DP models by calling DeePMD-kit's command line interface (CLI) in the local or remote server. Details can be found in [this paper](#).

10.6.5 MLatom

[MLatom](#) provides an interface to the DeePMD-kit within MLatom's workflow by calling DeePMD-kit's CLI. Details can be found in [this paper](#).

10.6.6 ABACUS

ABACUS can run molecular dynamics with a DP model. User is required to [build ABACUS with DeePMD-kit](#).

USE NVNMD

11.1 Introduction

NVNMD stands for non-von Neumann molecular dynamics.

This is the training code we used to generate the results in our paper entitled “Accurate and Efficient Molecular Dynamics based on Machine Learning and non von Neumann Architecture”, which has been accepted by npj Computational Materials (DOI: [10.1038/s41524-022-00773-z](https://doi.org/10.1038/s41524-022-00773-z)).

Any user can follow two consecutive steps to run molecular dynamics (MD) on the proposed NVNMD computer, which has been released online: (i) to train a machine learning (ML) model that can decently reproduce the potential energy surface (PES); and (ii) to deploy the trained ML model on the proposed NVNMD computer, then run MD there to obtain the atomistic trajectories.

11.2 Training

Our training procedure consists of not only continuous neural network (CNN) training but also quantized neural network (QNN) training which uses the results of CNN as inputs. It is performed on CPU or GPU by using the training codes we open-sourced online.

To train an ML model that can decently reproduce the PES, a training and testing data set should be prepared first. This can be done by using either the state-of-the-art active learning tools or the outdated (i.e., less efficient) brute-force density functional theory (DFT)-based ab-initio molecular dynamics (AIMD) sampling.

If you just want to simply test the training function, you can use the example in the `$deepmd_source_dir/examples/nvnmd` directory. If you want to fully experience training and running MD functions, you can download the complete example from the [website](#).

Then, copy the data set to the working directory

```
mkdir -p $workspace
cd $workspace
mkdir -p data
cp -r $dataset data
```

where `$dataset` is the path to the data set and `$workspace` is the path to the working directory.

11.2.1 Input script

Create and go to the training directory.

```
mkdir train
cd train
```

Then copy the input script `train_cnn.json` and `train_qnn.json` to the directory `train`

```
cp -r $deepmd_source_dir/examples/nvnmd/train/train_cnn.json train_cnn.json
cp -r $deepmd_source_dir/examples/nvnmd/train/train_qnn.json train_qnn.json
```

The structure of the input script is as follows

```
{
  "nvnmd" : {},
  "learning_rate" : {},
  "loss" : {},
  "training": {}
}
```

nvnmd

The “nvnmd” section is defined as

```
{
  "net_size":128,
  "sel":[60, 60],
  "rcut":6.0,
  "rcut_smth":0.5
}
```

where items are defined as:

Item	Mean	Optional Value
net_size	the size of nueral network	128
sel	the number of neighbors	integer list of lengths 1 to 4 are acceptable
rcut	the cutoff radial	(0, 8.0]
rcut_smth	the smooth cutoff parameter	(0, 8.0]

learning_rate

The “learning_rate” section is defined as

```
{
  "type": "exp",
  "start_lr": 1e-3,
  "stop_lr": 3e-8,
  "decay_steps": 5000
}
```

where items are defined as:

Item	Mean	Optional Value
type	learning rate variant type	exp
start_lr	the learning rate at the beginning of the training	a positive real number
stop_lr	the desired learning rate at the end of the training	a positive real number
decay_stops	the learning rate is decaying every {decay_stops} training steps	a positive integer

loss

The “loss” section is defined as

```
{
  "start_pref_e": 0.02,
  "limit_pref_e": 2,
  "start_pref_f": 1000,
  "limit_pref_f": 1,
  "start_pref_v": 0,
  "limit_pref_v": 0
}
```

where items are defined as:

Item	Mean	Optional Value
start_pref_e	the loss factor of energy at the beginning of the training	zero or positive real number
limit_pref_e	the loss factor of energy at the end of the training	zero or positive real number
start_pref_f	the loss factor of force at the beginning of the training	zero or positive real number
limit_pref_f	the loss factor of force at the end of the training	zero or positive real number
start_pref_v	the loss factor of virial at the beginning of the training	zero or positive real number
limit_pref_v	the loss factor of virial at the end of the training	zero or positive real number

training

The “training” section is defined as

```
{
  "seed": 1,
  "stop_batch": 1000000,
  "numb_test": 1,
  "disp_file": "lcurve.out",
  "disp_freq": 1000,
  "save_ckpt": "model.ckpt",
  "save_freq": 10000,
  "training_data": {
    "systems": ["system1_path", "system2_path", "..."],
    "set_prefix": "set",
    "batch_size": ["batch_size_of_system1", "batch_size_of_system2", "..."]
  }
}
```

where items are defined as:

Item	Mean	Optional Value
seed	the random seed	a integer
stop_batch	the total training steps	a positive integer
numb_test	the accuracy is test by using {numb_test} sample	a positive integer
disp_file	the log file where the training message display	a string
disp_freq	display frequency	a positive integer
save_ckpt	check point file	a string
save_freq	save frequency	a positive integer
systems	a list of data directory which contains the dataset	string list
set_prefix	the prefix of dataset	a string
batch_size	a list of batch size of corresponding dataset	a integer list

11.2.2 Training

Training can be invoked by

```
# step1: train CNN
dp train-nvnmd train_cnn.json -s s1
# step2: train QNN
dp train-nvnmd train_qnn.json -s s2
```

After the training process, you will get two folders: `nvnmmd_cnn` and `nvnmmd_qnn`. The `nvnmmd_cnn` contains the model after continuous neural network (CNN) training. The `nvnmmd_qnn` contains the model after quantized neural network (QNN) training. The binary file `nvnmmd_qnn/model.pb` is the model file that is used to perform NVNMD in the server [<http://nvnmmd.picp.vip>].

You can also restart the CNN training from the checkpoint (`nvnmmd_cnn/model.ckpt`) by

```
dp train-nvnmd train_cnn.json -r nvnmmd_cnn/model.ckpt -s s1
```

11.3 Testing

The frozen model can be used in many ways. The most straightforward testing can be invoked by

```
mkdir test
dp test -m ./nvnmmd_qnn/frozen_model.pb -s path/to/system -d ./test/detail -n 99999 -l test/output.
↪ log
```

where the frozen model file to import is given via the `-m` command line flag, the path to the testing data set is given via the `-s` command line flag, and the file containing details of energy, forces and virials accuracy is given via the `-d` command line flag, the amount of data for testing is given via the `-n` command line flag.

11.4 Running MD

After CNN and QNN training, you can upload the ML model to our online NVNMD system and run MD there.

11.4.1 Account application

The server website of NVNMD is available at <http://nvnmd.picp.vip>. You can visit the URL and enter the login interface (Figure.1).

NVNMD

[User guide](#)

[Switch to Chinese](#)

Username

Password

To apply for an account, please email:
jie_liu@hnu.edu.cn, liujie@uw.edu

To obtain an account, please send your application to the email (jie_liu@hnu.edu.cn, liujie@uw.edu). The username and password will be sent to you by email.

11.4.2 Adding task

After successfully obtaining the account, enter the username and password in the login interface, and click “Login” to enter the homepage (Figure.2).

NVNMD

Current user: test1 [Logout](#)

Remaining calculation time: 6:22:29

[Add a new task](#)

[Operation records](#)

Calculation records [Refresh](#)
[Clear calculation records](#)

Submission time	Task name	Input script	Calculation status	Cancel calculation	Calculation time	Download results	Delete record
-----------------	-----------	--------------	--------------------	--------------------	------------------	------------------	---------------

The homepage displays the remaining calculation time and all calculation records not deleted. Click **Add a new task** to enter the interface for adding a new task (Figure.3).

NVNMD

Current user: test1 [Return to home page](#)

Remaining calculation time: 6:22:29

Task name	<input type="text" value="test"/>
Upload mode ?	Manual upload <input type="button" value="v"/>
Input script	<input type="button" value="Browse..."/> in.lmp
Model file	<input type="button" value="Browse..."/> model.pb
Data files	<input type="button" value="Browse..."/> coord.lmp

- Task name: name of the task
- Upload mode: two modes of uploading results to online data storage, including **Manual upload** and **Automatic upload**. Results need to be uploaded manually to online data storage with **Manual upload** mode and will be uploaded automatically with **Automatic upload** mode.
- Input script: input file of the MD simulation.

In the input script, one needs to specify the pair style as follows

```
pair_style nvnmd model.pb
pair_coeff * *
```

- Model file: the ML model named `model.pb` obtained by QNN training.
- Data files: data files containing the information required for running an MD simulation (e.g., `coord.lmp` containing initial atom coordinates).

Next, you can click **Submit** to submit the task and then automatically return to the homepage (Figure.4).

NVNMD

result.out	13.5 KB	Download		Upload

If **Manual upload** mode is selected or the file has expired, click **Upload** on the download interface to upload manually.

11.4.5 Deleting record

For the task no longer needed, you can click the corresponding **Delete** on the homepage to delete the record. Records cannot be retrieved after deletion.

11.4.6 Clearing records

Click **Clear calculation records** on the homepage to clear all records.

Records cannot be retrieved after clearing.

FAQS

As a consequence of differences in computers or systems, problems may occur. Some common circumstances are listed as follows. In addition, some frequently asked questions are listed as follows. If other unexpected problems occur, you're welcome to contact us for help.

12.1 How to tune Fitting/embedding-net size ?

Here are some test forms on fitting-net size tuning or embedding-net size tuning performed on several different systems.

12.1.1 Al2O3

Fitting net size tuning form on Al2O3: (embedding-net size: [25,50,100])

Fitting-net size	Energy L2err(eV)	Energy L2err/Natoms(eV)	Force L2err(eV/Angstrom)
[240,240,240]	1.742252e-02	7.259383e-05	4.014115e-02
[80,80,80]	1.799349e-02	7.497287e-05	4.042977e-02
[40,40,40]	1.799036e-02	7.495984e-05	4.068806e-02
[20,20,20]	1.834032e-02	7.641801e-05	4.094784e-02
[10,10,10]	1.913058e-02	7.971073e-05	4.154775e-02
[5,5,5]	1.932914e-02	8.053808e-05	4.188052e-02
[4,4,4]	1.944832e-02	8.103467e-05	4.217826e-02
[3,3,3]	2.068631e-02	8.619296e-05	4.300497e-02
[2,2,2]	2.267962e-02	9.449840e-05	4.413609e-02
[1,1,1]	2.813596e-02	1.172332e-04	4.781115e-02
[]	3.135002e-02	1.306251e-04	5.373120e-02

[] means no hidden layer, but there is still a linear output layer. This situation is equal to the linear regression.

12.2 How to control the parallelism of a job?

DeePMD-kit has three levels of parallelism. To get the best performance, one should control the number of threads used by DeePMD-kit. One should make sure the product of the parallel numbers is less than or equal to the number of cores available.

12.2.1 MPI (optional)

Parallelism for MPI is optional and used for multiple nodes, multiple GPU cards, or sometimes multiple CPU cores.

To enable MPI support for training, one should [install horovod](#) in advance. Note that the parallelism mode is data parallelism, so it is not expected to see the training time per batch decreases.

MPI support for inference is not directly supported by DeePMD-kit, but indirectly supported by the third-party software. For example, [LAMMPS enables running simulations in parallel](#) using the MPI parallel communication standard with distributed data. That software has to build against MPI.

Set the number of processes with:

```
mpirun -np $num_nodes dp
```

Note that `mpirun` here should be the same as the MPI used to build software. For example, one can use `mpirun -h` and `lmp -h` to see if `mpirun` and LAMMPS has the same MPI version.

Sometimes, `$num_nodes` and the nodes information can be directly given by the HPC scheduler system, if the MPI used here is the same as the MPI used to build the scheduler system. Otherwise, one have to manually assign these information.

12.2.2 Parallelism between independent operators

For CPU devices, TensorFlow use multiple streams to run independent operators (OP).

```
export TF_INTER_OP_PARALLELISM_THREADS=3
```

However, for GPU devices, TensorFlow uses only one compute stream and multiple copy streams. Note that some of DeePMD-kit OPs do not have GPU support, so it is still encouraged to set environmental variables even if one has a GPU.

12.2.3 Parallelism within an individual operators

For CPU devices, `TF_INTRA_OP_PARALLELISM_THREADS` controls parallelism within TensorFlow native OPs when TensorFlow is built against Eigen.

```
export TF_INTRA_OP_PARALLELISM_THREADS=2
```

`OMP_NUM_THREADS` is threads for OpenMP parallelism. It controls parallelism within TensorFlow native OPs when TensorFlow is built by Intel OneDNN and DeePMD-kit custom CPU OPs. It may also control parallelism for NumPy when NumPy is built against OpenMP, so one who uses GPUs for training should also care this environmental variable.

```
export OMP_NUM_THREADS=2
```

There are several other environmental variables for OpenMP, such as `KMP_BLOCKTIME`. See [Intel documentation](#) for detailed information.

12.2.4 Tune the performance

There is no one general parallel configuration that works for all situations, so you are encouraged to tune parallel configurations yourself after empirical testing.

Here are some empirical examples. If you wish to use 3 cores of 2 CPUs on one node, you may set the environmental variables and run DeePMD-kit as follows:

```
export OMP_NUM_THREADS=3
export TF_INTRA_OP_PARALLELISM_THREADS=3
export TF_INTER_OP_PARALLELISM_THREADS=2
dp train input.json
```

For a node with 128 cores, it is recommended to start with the following variables:

```
export OMP_NUM_THREADS=16
export TF_INTRA_OP_PARALLELISM_THREADS=16
export TF_INTER_OP_PARALLELISM_THREADS=8
```

Again, in general, one should make sure the product of the parallel numbers is less than or equal to the number of cores available. In the above case, $16 \times 8 = 128$, so threads will not compete with each other.

12.3 Do we need to set `rcut < half boxsize`?

When seeking the neighbors of atom *i* under periodic boundary conditions, DeePMD-kit considers all *j* atoms within cutoff `rcut` from atom *i* in all mirror cells.

So, there is no limitation on the setting of `rcut`.

PS: The reason why some software requires `rcut < half box size` is that they only consider the nearest mirrors from the center cell. DeePMD-kit is different from them.

12.4 How to set `sel`?

`sel` is short for “selected number of atoms in `rcut`”.

`sel_a[i]` is a list of integers. The length of the list should be the same as the number of atom types in the system.

`sel_a[i]` gives the number of the selected number of type *i* neighbors within `rcut`. To ensure that the results are strictly accurate, `sel_a[i]` should be larger than the largest number of type *i* neighbors in the `rcut`.

However, the computation overhead increases with `sel_a[i]`, therefore, `sel_a[i]` should be as small as possible.

The setting of `sel_a[i]` should balance the above two considerations.

12.5 Installation

12.5.1 Inadequate versions of gcc/g++

Sometimes you may use a gcc/g++ of version < 4.8. In this way, you can still compile all the parts of TensorFlow and most of the parts of DeePMD-kit, but i-Pi and GROMACS plugins will be disabled automatically. Or if you have a gcc/g++ of version > 4.8, say, 7.2.0, you may choose to use it by doing

```
export CC=/path/to/gcc-7.2.0/bin/gcc
export CXX=/path/to/gcc-7.2.0/bin/g++
```

12.5.2 Build files left in DeePMD-kit

When you try to build a second time when installing DeePMD-kit, files produced before may contribute to failure. Thus, you may clear them by

```
cd build
rm -r *
```

and redo the cmake process.

12.6 The temperature undulates violently during the early stages of MD

This is probably because your structure is too far from the equilibrium configuration.

To make sure the potential model is truly accurate, we recommend checking model deviation.

12.7 MD: cannot run LAMMPS after installing a new version of DeePMD-kit

This typically happens when you install a new version of DeePMD-kit and copy directly the generated USER-DEEPMDS to a LAMMPS source code folder and re-install LAMMPS.

To solve this problem, it suffices to first remove USER-DEEPMDS from the LAMMPS source code by

```
make no-user-deepmd
```

and then install the new USER-DEEPMDS.

If this does not solve your problem, try to decompress the LAMMPS source tarball and install LAMMPS from scratch again, which typically should be very fast.

12.8 Model compatibility

When the version of DeePMD-kit used to train the model is different from the that of DeePMD-kit running MDs, one has the problem of model compatibility.

DeePMD-kit guarantees that the codes with the same major and minor revisions are compatible. That is to say, v0.12.5 is compatible with v0.12.0, but is not compatible with v0.11.0 or v1.0.0.

One can execute `dp convert-from` to convert an old model to a new one.

Model version	v0.12	v1.0	v1.1	v1.2	v1.3	v2.0	v2.1
Compatibility	😊	😊	😊	😊	😊	😊	😊

Legend:

- 😊: The model is compatible with the DeePMD-kit package.
- 😊: The model is incompatible with the DeePMD-kit package, but one can execute `dp convert-from` to convert an old model to v2.1.
- 😊: The model is incompatible with the DeePMD-kit package, and there is no way to convert models.

12.9 Why does a model have low precision?

Many phenomena are caused by model accuracy. For example, during simulations, temperatures explode, structures fall apart, and atoms are lost. One can [test the model](#) to confirm whether the model has the enough accuracy.

There are many reasons for a low-quality model. Some common reasons are listed below.

12.9.1 Data

Data units and signs

The unit of training data should follow what is listed in [data section](#). Usually, the package to calculate the training data has different units from those of the DeePMD-kit. It is noted that some software label the energy gradient as forces, instead of the negative energy gradient. It is necessary to check them carefully to avoid inconsistent data.

SCF coverage and data accuracy

The accuracy of models will not exceed the accuracy of training data, so the training data should reach enough accuracy. Here is a checklist for the accuracy of data:

- SCF should converge to a suitable threshold for all points in the training data.
- The convergence of the energy, force and virial with respect to the energy cutoff and k-spacing sample is checked.
- Sometimes, QM software may generate unstable outliers, which should be removed.
- The data should be extracted with enough digits and stored with the proper precision. Large energies may have low precision when they are stored as the single-precision floating-point format (FP32).

Enough data

If the model performs good on the training data, but has bad accuracy on another data, this means some data space is not covered by the training data. It can be validated by evaluating the [model deviation](#) with multiple models. If the model deviation of these data is high for some data, try to collect more data using [DP-GEN](#).

Values of data

One should be aware that the errors of some data is also affected by the absolute values of this data. Stable structures tend to be more precise than unstable structures because unstable structures may have larger forces. Also, errors will be introduced in the Projector augmented wave (PAW) DFT calculations when the atoms are very close due to the overlap of pseudo-potentials. It is expected to see that data with large forces has larger errors and it is better to compare different models only with the same data.

12.9.2 Model

Enough sel

The `sel` of the descriptors must be enough for both training and test data. Otherwise, the model will be unreliable and give wrong results.

Cutoff radius

The model cannot fit the long-term interaction out of the cutoff radius. This is a designed approximation for performance, but one has to choose proper cutoff radius for the system.

Neural network size

The size of neural networks will affect the accuracy, but if one follows the parameters in the examples, this effect is insignificant. See [FAQ: How to tune Fitting/embedding-net size](#) for details.

Neural network precision

In some cases, one may want to use the FP32 precision to make the model faster. For some applications, FP32 is enough and thus is recommended, but one should still be aware that the precision of FP32 is not as high as that of FP64.

12.9.3 Training

Training steps

Generally speaking, the longer the number of training steps, the better the model. A balance between model accuracy and training time can be achieved. If one finds that model accuracy decreases with training time, there may be a problem with the data. See the [data section](#) for details.

Learning rate

Both too large and too small learning rate may affect the training. It is recommended to start with a large learning rate and end with a small learning rate. The learning rate from the examples is a good choice to start.

FIND DEEPM-D-KIT C/C++ LIBRARY FROM CMAKE

After DeePMD-kit C/C++ library is installed, one can find DeePMD-kit from CMake:

```
find_package(DeePMD REQUIRED)
```

Note that you may need to add `${deepmd_root}` to the cached CMake variable `CMAKE_PREFIX_PATH`.

To link against the C interface library, using

```
target_link_libraries(some_library PRIVATE DeePMD::deepmd_c)
```

To link against the C++ interface library, using

```
target_link_libraries(some_library PRIVATE DeePMD::deepmd_cc)
```

CODING CONVENTIONS

14.1 Preface

The aim of these coding standards is to help create a codebase with a defined and consistent coding style that every contributor can get easily familiar with. This will enhance code readability as there will be no different coding styles from different contributors and everything will be documented. Also, PR diffs will be smaller because of the unified coding style. Finally, static typing will help in hunting down potential bugs before the code is even run.

Contributed code will not be refused merely because it does not strictly adhere to these conditions; as long as it's internally consistent, clean, and correct, it probably will be accepted. But don't be surprised if the "offending" code gets fiddled with overtime to conform to these conventions.

There are also GitHub actions CI checks for python code style which will annotate the PR diff for you to see the areas where your code is lacking compared to the set standard.

14.2 Rules

The code must be compatible with the oldest supported version of python which is 3.7

The project follows the generic coding conventions as specified in the [Style Guide for Python Code](#), [Docstring Conventions](#) and [Typing Conventions](#) PEPs, clarified and extended as follows:

- Do not use "*" imports such as `from module import *`. Instead, list imports explicitly.
- Use 4 spaces per indentation level. No tabs.
- No one-liner compound statements (i.e., no `if x: return:` use two lines).
- Maximum line length is 88 characters as recommended by [black](#) which is less strict than [Docstring Conventions](#) suggests.
- Use "StudlyCaps" for class names.
- Use "lowercase" or "lowercase_with_underscores" for function, method, variable names and module names. For short names, joined lowercase may be used (e.g. "tagname"). Choose what is most readable.
- No single-character variable names, except indices in loops that encompass a very small number of lines (`for i in range(5): ...`).
- Avoid lambda expressions. Use named functions instead.
- Avoid functional constructs (filter, map, etc.). Use list comprehensions instead.
- Use "double quotes" for string literals, and `"""triple double quotes"""` for docstring's. Single quotes are OK for something like

```
f"something {'this' if x else 'that'}"
```

- Use f-strings `s = f"{x:.2f}"` instead of old style formatting with `"%f" % x`. string format method `"{x:.2f}".format()` may be used sparsely where it is more convenient than f-strings.

14.3 Whitespace

Python is not C/C++ so whitespace should be used sparingly to maintain code readability

- Read the Whitespace in Expressions and Statements section of [PEP8](#).
- Avoid [trailing whitespaces](#).
- Do not use excessive whitespace in your expressions and statements.
- You should have blank spaces after commas, colons, and semi-colons if it isn't trailing next to the end of a bracket, brace, or parentheses.
- With any operators you should use space on both sides of the operator.
- Colons for slicing are considered a binary operator, and should not have any spaces between them.
- You should have parentheses with no space, directly next to the function when calling functions `function()`.
- When indexing or slicing the brackets should be directly next to the collection with no space `collection["index"]`.
- Whitespace used to line up variable values is not recommended.
- Make sure you are consistent with the formats you choose when optional choices are available.

14.4 General advice

- Get rid of as many `break` and `continue` statements as possible.
- Write short functions. All functions should fit within a standard screen.
- Use descriptive variable names.

14.5 Writing documentation in the code

Here is an example of how to write good docstrings:

<https://github.com/numpy/numpy/blob/master/doc/example.py>

The NumPy docstring documentation can be found [here](#)

It is a good practice to run [pydocstyle](#) check on your code or use a text editor that does it automatically):

```
$ pydocstyle filename.py
```

14.6 Run pycodestyle on your code

It's a good idea to run `pycodestyle` on your code (or use a text editor that does it automatically):

```
$ pycodestyle filename.py
```

14.7 Run mypy on your code

It's a good idea to run `mypy` on your code (or use a text editor that does it automatically):

```
$ mypy filename.py
```

14.8 Run pydocstyle on your code

It's a good idea to run `pycodestyle` on your code (or use a text editor that does it automatically):

```
$ pycodestyle filename.py --max-line-length=88
```

14.9 Run black on your code

Another method of enforcing `PEP8` is using a tool such as `black`. These tools tend to be very effective at cleaning up code but should be used carefully and code should be retested after cleaning it. Try:

```
$ black --help
```

CREATE A MODEL

If you'd like to create a new model that isn't covered by the existing DeePMD-kit library, but reuse DeePMD-kit's other efficient modules such as data processing, trainer, etc, you may want to read this section.

To incorporate your custom model you'll need to:

1. Register and implement new components (e.g. descriptor) in a Python file. You may also want to register new TensorFlow OPs if necessary.
2. Register new arguments for user inputs.
3. Package new codes into a Python package.
4. Test new models.

15.1 Design a new component

When creating a new component, take descriptor as the example, you should inherit `deepmd.descriptor.descriptor.Descriptor` class and override several methods. Abstract methods such as `deepmd.descriptor.descriptor.Descriptor.build` must be implemented and others are not. You should keep arguments of these methods unchanged.

After implementation, you need to register the component with a key:

```
from deepmd.descriptor import Descriptor

@Descriptor.register("some_descrpt")
class SomeDescriptor(Descriptor):
    def __init__(self, arg1: bool, arg2: float) -> None:
        pass
```

15.2 Register new arguments

To let someone uses your new component in their input file, you need to create a new method that returns some `Argument` of your new component, and then register new arguments. For example, the code below

```
from typing import List

from dargs import Argument
from deepmd.utils.argcheck import descrpt_args_plugin
```

(continues on next page)

(continued from previous page)

```
@descript_args_plugin.register("some_descript")
def descript_some_args() -> List[Argument]:
    return [
        Argument("arg1", bool, optional=False, doc="balabala"),
        Argument("arg2", float, optional=True, default=6.0, doc="haha"),
    ]
```

allows one to use your new descriptor as below:

```
"descriptor" :{
    "type": "some_descript",
    "arg1": true,
    "arg2": 6.0
}
```

The arguments here should be consistent with the class arguments of your new component.

15.3 Package new codes

You may use `setuptools` to package new codes into a new Python package. It's crucial to add your new component to `entry_points['deepmd']` in `setup.py`:

```
entry_points={
    'deepmd': [
        'some_descript=deepmd_some_descriptpt:SomeDescript',
    ],
},
```

where `deepmd_some_descriptpt` is the module of your codes. It is equivalent to `from deepmd_some_descriptpt import SomeDescript`.

If you place `SomeDescript` and `descript_some_args` into different modules, you are also expected to add `descript_some_args` to `entry_points`.

After you install your new package, you can now use `dp train` to run your new model.

ATOM TYPE EMBEDDING

16.1 Overview

Here is an overview of the DeePMD-kit algorithm. Given a specific centric atom, we can obtain the matrix describing its local environment, named \mathcal{R} . It consists of the distance between the centric atom and its neighbors, as well as a direction vector. We can embed each distance into a vector of M_1 dimension by an **embedding net**, so the environment matrix \mathcal{R} can be embedded into matrix \mathcal{G} . We can thus extract a descriptor vector (of $M_1 \times M_2$ dim) of the centric atom from the \mathcal{G} by some matrix multiplication, and put the descriptor into **fitting net** to get predicted energy E . The vanilla version of DeePMD-kit builds **embedding net** and **fitting net** relying on the atom type, resulting in $O(N)$ memory usage. After applying atom type embedding, in DeePMD-kit v2.0, we can share one **embedding net** and one **fitting net** in total, which decline training complexity largely.

16.2 Preliminary

In the following chart, you can find the meaning of symbols used to clarify the atom-type embedding algorithm.

i : Type of centric atom

j : Type of neighbor atom

s_{ij} : Distance between centric atom and neighbor atom

$\mathcal{G}_{ij}(\cdot)$: Origin embedding net, take s_{ij} as input and output embedding vector of M_1 dim

$\mathcal{G}(\cdot)$: Shared embedding net

$\text{Multi}(\cdot)$: Matrix multiplication and flattening, output the descriptor vector of $M_1 \times M_2$ dim

$F_i(\cdot)$: Origin fitting net, take the descriptor vector as input and output energy

$F(\cdot)$: Shared fitting net

$A(\cdot)$: Atom type embedding net, input is atom type, the output is type embedding vector of dim `nchan1`

So, we can formulate the training process as follows. Vanilla DeePMD-kit algorithm:

$$E = F_i(\text{Multi}(\mathcal{G}_{ij}(s_{ij})))$$

DeePMD-kit applying atom type embedding:

$$E = F([\text{Multi}(\mathcal{G}([s_{ij}, A(i), A(j)])), A(j)])$$

or

$$E = F(\text{Multi}(\mathcal{G}([s_{ij}, A(j)])), A(j))$$

The difference between the two variants above is whether using the information of centric atom when generating the descriptor. Users can choose by modifying the `type_one_side` hyper-parameter in the input JSON file.

16.3 How to use

A detailed introduction can be found at [se_e2_a_tebd](#). Looking for a fast start-up, you can simply add a `type_embedding` section in the input JSON file as displayed in the following, and the algorithm will adopt the atom type embedding algorithm automatically. An example of `type_embedding` is like

```
"type_embedding":{
  "neuron":    [2, 4, 8],
  "resnet_dt": false,
  "seed":      1
}
```

16.4 Code Modification

Atom-type embedding can be applied to varied `embedding net` and `fitting net`, as a result, we build a class `TypeEmbedNet` to support this free combination. In the following, we will go through the execution process of the code to explain our code modification.

16.4.1 trainer (train/trainer.py)

In `trainer.py`, it will parse the parameter from the input JSON file. If a `type_embedding` section is detected, it will build a `TypeEmbedNet`, which will be later input in the `model`. `model` will be built in the function `_build_network`.

16.4.2 model (model/ener.py)

When building the operation graph of the `model` in `model.build`. If a `TypeEmbedNet` is detected, it will build the operation graph of `type embed net`, `embedding net` and `fitting net` by order. The building process of `type embed net` can be found in `TypeEmbedNet.build`, which output the type embedding vector of each atom type (of `[ntypes × nchanl]` dimensions). We then save the type embedding vector into `input_dict`, so that they can be fetched later in `embedding net` and `fitting net`.

16.4.3 embedding net (descriptor/se*.py)

In **embedding net**, we shall take local environment \mathcal{R} as input and output matrix \mathcal{G} . Functions called in this process by the order is

```
build -> _pass_filter -> _filter -> _filter_lower
```

_pass_filter: It will first detect whether an atom type embedding exists, if so, it will apply atom type embedding algorithm and doesn't divide the input by type.

_filter: It will call **_filter_lower** function to obtain the result of matrix multiplication ($\mathcal{G}^T \cdot \mathcal{R}$), do further multiplication involved in **Multi**(\cdot), and finally output the result of descriptor vector of $M_1 \times M_2$ dim.

_filter_lower: The main function handling input modification. If type embedding exists, it will call **_concat_type_embedding** function to concat the first column of input \mathcal{R} (the column of s_{ij}) with the atom type embedding information. It will decide whether to use the atom type embedding vector of the centric atom according to the value of **type_one_side** (if set True, then we only use the vector of the neighbor atom). The modified input will be put into the **fitting net** to get \mathcal{G} for further matrix multiplication stage.

16.4.4 fitting net (fit/ener.py)

In **fitting net**, it takes the descriptor vector as input, whose dimension is $[\text{natoms}, M_1 \times M_2]$. Because we need to involve information on the centric atom in this step, we need to generate a matrix named **atype_embed** (of dim $[\text{natoms}, \text{nchan}]$), in which each row is the type embedding vector of the specific centric atom. The input is sorted by type of centric atom, we also know the number of a particular atom type (stored in **natoms**[2+i]), thus we get the type vector of the centric atom. In the build phase of the fitting net, it will check whether type embedding exists in **input_dict** and fetch them. After that, call **embed_atom_type** function to look up the embedding vector for the type vector of the centric atom to obtain **atype_embed**, and concat input with it (**[input, atype_embed]**). The modified input goes through **fitting net** to get predicted energy.

Note: You can't apply the compression method while using atom-type embedding.

17.1 deepmd package

Root of the deepmd package, exposes all public classes and submodules.

```
class deepmd.DeepEval(model_file: Path, load_prefix: str = 'load', default_tf_graph: bool = False,
                      auto_batch_size: bool | int | AutoBatchSize = False)
```

Bases: `object`

Common methods for DeepPot, DeepWFC, DeepPolar, ...

Parameters

`model_file`

[`Path`] The name of the frozen model file.

`load_prefix`: `str`

The prefix in the load computational graph

`default_tf_graph`

[`bool`] If uses the default tf graph, otherwise build a new tf graph for evaluation

`auto_batch_size`

[`bool` or `int` or `AutomaticBatchSize`, default: `False`] If True, automatic batch size will be used. If int, it will be used as the initial batch size.

Attributes

`model_type`

Get type of model.

`model_version`

Get version of model.

`sess`

Get TF session.

Methods

<code>eval_typeebd()</code>	Evaluate output of type embedding network by using this model.
<code>make_natoms_vec(atom_types[, mixed_type])</code>	Make the natom vector used by deepmd-kit.
<code>reverse_map(vec, imap)</code>	Reverse mapping of a vector according to the index map.
<code>sort_input(coord, atom_type[, sel_atoms, ...])</code>	Sort atoms in the system according their types.

`eval_typeebd()` → `ndarray`

Evaluate output of type embedding network by using this model.

Returns

`np.ndarray`

The output of type embedding network. The shape is `[ntypes, o_size]`, where `ntypes` is the number of types, and `o_size` is the number of nodes in the output layer.

Raises

`KeyError`

If the model does not enable type embedding.

See also:

`deepmd.utils.type_embed.TypeEmbedNet`

The type embedding network.

Examples

Get the output of type embedding network of graph.pb:

```
>>> from deepmd.infer import DeepPotential
>>> dp = DeepPotential('graph.pb')
>>> dp.eval_typeebd()
```

`load_prefix:` `str`

`make_natoms_vec(atom_types: ndarray, mixed_type: bool = False)` → `ndarray`

Make the natom vector used by deepmd-kit.

Parameters

`atom_types`

The type of atoms

`mixed_type`

Whether to perform the mixed_type mode. If True, the input data has the mixed_type format (see doc/model/train_se_atten.md), in which frames in a system may have different natoms_vec(s), with the same nloc.

Returns

`natoms`

The number of atoms. This tensor has the length of `Ntypes + 2` `natoms[0]`: number of local atoms `natoms[1]`: total number of atoms held by this processor `natoms[i]`: $2 \leq i < Ntypes+2$, number of type `i` atoms

```

property model_type: str
    Get type of model.
    :type:str

property model_version: str
    Get version of model.
    Returns
    str
        version of model

static reverse_map(vec: ndarray, imap: List[int]) → ndarray
    Reverse mapping of a vector according to the index map.
    Parameters
    vec
        Input vector. Be of shape [nframes, natoms, -1]
    imap
        Index map. Be of shape [natoms]
    Returns
    vec_out
        Reverse mapped vector.

property sess: Session
    Get TF session.

static sort_input(coord: ndarray, atom_type: ndarray, sel_atoms: List[int] | None = None,
    mixed_type: bool = False)
    Sort atoms in the system according their types.
    Parameters
    coord
        The coordinates of atoms. Should be of shape [nframes, natoms, 3]
    atom_type
        The type of atoms Should be of shape [natoms]
    sel_atoms
        The selected atoms by type
    mixed_type
        Whether to perform the mixed_type mode. If True, the input data has the
        mixed_type format (see doc/model/train_se_atten.md), in which frames in a sys-
        tem may have different natoms_vec(s), with the same nloc.
    Returns
    coord_out
        The coordinates after sorting
    atom_type_out
        The atom types after sorting
    idx_map
        The index mapping from the input to the output. For example coord_out = co-
        ord[:,idx_map,:]

```

sel_atom_type

Only output if sel_atoms is not None The sorted selected atom types

sel_idx_map

Only output if sel_atoms is not None The index mapping from the selected atoms to sorted selected atoms.

`deepmd.DeepPotential(model_file: str | Path, load_prefix: str = 'load', default_tf_graph: bool = False) → DeepDipole | DeepGlobalPolar | DeepPolar | DeepPot | DeepWFC`

Factory function that will initialize appropriate potential read from model_file.

Parameters

model_file

[str] The name of the frozen model file.

load_prefix

[str] The prefix in the load computational graph

default_tf_graph

[bool] If uses the default tf graph, otherwise build a new tf graph for evaluation

Returns

`Union[DeepDipole, DeepGlobalPolar, DeepPolar, DeepPot, DeepWFC]`

one of the available potentials

Raises

`RuntimeError`

if model file does not correspond to any implemented potential

```
class deepmd.DipoleChargeModifier(model_name: str, model_charge_map: List[float],
                                   sys_charge_map: List[float], ewald_h: float = 1, ewald_beta: float = 1)
```

Bases: `DeepDipole`

Parameters

model_name

The model file for the DeepDipole model

model_charge_map

Gives the amount of charge for the wfcc

sys_charge_map

Gives the amount of charge for the real atoms

ewald_h

Grid spacing of the reciprocal part of Ewald sum. Unit: Å

ewald_beta

Splitting parameter of the Ewald sum. Unit: Å⁻¹

Attributes

model_type

Get type of model.

model_version

Get version of model.

sess

Get TF session.

Methods

<code>build_fv_graph()</code>	Build the computational graph for the force and virial inference.
<code>eval(coord, box, atype[, eval_fv])</code>	Evaluate the modification.
<code>eval_full(coords, cells, atom_types[, ...])</code>	Evaluate the model with interface similar to the energy model.
<code>eval_typeebd()</code>	Evaluate output of type embedding network by using this model.
<code>get_dim_ainparam()</code>	Unsupported in this model.
<code>get_dim_fparam()</code>	Unsupported in this model.
<code>get_ntypes()</code>	Get the number of atom types of this model.
<code>get_rcut()</code>	Get the cut-off radius of this model.
<code>get_sel_type()</code>	Get the selected atom types of this model.
<code>get_type_map()</code>	Get the type map (element name of the atom types) of this model.
<code>make_natoms_vec(atom_types[, mixed_type])</code>	Make the natom vector used by deepmd-kit.
<code>modify_data(data)</code>	Modify data.
<code>reverse_map(vec, imap)</code>	Reverse mapping of a vector according to the index map.
<code>sort_input(coord, atom_type[, sel_atoms, ...])</code>	Sort atoms in the system according their types.

`build_fv_graph()` → Tensor

Build the computational graph for the force and virial inference.

`eval(coord: ndarray, box: ndarray, atype: ndarray, eval_fv: bool = True)` → Tuple[ndarray, ndarray, ndarray]

Evaluate the modification.

Parameters

`coord`
The coordinates of atoms

`box`
The simulation region. PBC is assumed

`atype`
The atom types

`eval_fv`
Evaluate force and virial

Returns

`tot_e`
The energy modification

`tot_f`
The force modification

`tot_v`
The virial modification

`load_prefix:` str

`modify_data(data: dict) → None`

Modify data.

Parameters

data

Internal data of DeepmdData. Be a dict, has the following keys - coord coordinates - box simulation box - type atom types - find_energy tells if data has energy - find_force tells if data has force - find_virial tells if data has virial - energy energy - force force - virial virial

17.1.1 Subpackages

`deepmd.cluster` package

Module that reads node resources, auto detects if running local or on SLURM.

`deepmd.cluster.get_resource() → Tuple[str, List[str], List[int] | None]`

Get local or slurm resources: nodename, nodelist, and gpus.

Returns

`Tuple[str, List[str], Optional[List[int]]]`
nodename, nodelist, and gpus

Submodules

`deepmd.cluster.local` module

Get local GPU resources.

`deepmd.cluster.local.get_gpus()`

Get available IDs of GPU cards at local. These IDs are valid when used as the TensorFlow device ID.

Returns

`Optional[List[int]]`
List of available GPU IDs. Otherwise, None.

`deepmd.cluster.local.get_resource() → Tuple[str, List[str], List[int] | None]`

Get local resources: nodename, nodelist, and gpus.

Returns

`Tuple[str, List[str], Optional[List[int]]]`
nodename, nodelist, and gpus

deepmd.cluster.slurm module

Module to get resources on SLURM cluster.

References

https://github.com/deepsense-ai/tensorflow_on_slurm ####

`deepmd.cluster.slurm.get_resource()` → `Tuple[str, List[str], List[int] | None]`

Get SLURM resources: nodename, nodelist, and gpus.

Returns

`Tuple[str, List[str], Optional[List[int]]]`
nodename, nodelist, and gpus

Raises

`RuntimeError`
if number of nodes could not be retrieved

`ValueError`
list of nodes is not of the same length as a number of nodes

`ValueError`
if current nodename is not found in node list

deepmd.descriptor package

`class deepmd.descriptor.Descriptor(*args, **kwargs)`

Bases: *PluginVariant*

The abstract class for descriptors. All specific descriptors should be based on this class.

The descriptor \mathcal{D} describes the environment of an atom, which should be a function of coordinates and types of its neighbour atoms.

Notes

Only methods and attributes defined in this class are generally public, that can be called by other classes.

Examples

```
>>> descript = Descriptor(type="se_e2_a", rcut=6., rcut_smth=0.5, sel=[50])
>>> type(descript)
<class 'deepmd.descriptor.se_a.DescriptSeA'>
```

Methods

<i>build</i> (coord_, atype_, natoms, box_, mesh, ...)	Build the computational graph for the descriptor.
<i>build_type_exclude_mask</i> (exclude_types, ...)	Build the type exclude mask for the descriptor.
<i>compute_input_stats</i> (data_coord, data_box, ...)	Compute the statistics (avg and std) of the training data.
<i>enable_compression</i> (min_nbor_dist, graph, ...)	Reveive the statistics (distance, max_nbor_size and env_mat_range) of the training data.
<i>enable_mixed_precision</i> ([mixed_prec])	Reveive the mixed precision setting.
<i>get_dim_out</i> ()	Returns the output dimension of this descriptor.
<i>get_dim_rot_mat_1</i> ()	Returns the first dimension of the rotation matrix.
<i>get_feed_dict</i> (coord_, atype_, natoms, box, mesh)	Generate the feed_dict for current descriptor.
<i>get_nlist</i> ()	Returns neighbor information.
<i>get_ntypes</i> ()	Returns the number of atom types.
<i>get_rcut</i> ()	Returns the cut-off radius.
<i>get_tensor_names</i> ([suffix])	Get names of tensors.
<i>init_variables</i> (graph, graph_def[, suffix])	Init the embedding net variables with the given dict.
<i>pass_tensors_from_frz_model</i> (*tensors)	Pass the descript_reshape tensor as well as descript_deriv tensor from the frz graph_def.
<i>prod_force_virial</i> (atom_ener, natoms)	Compute force and virial.
<i>register</i> (key)	Register a descriptor plugin.

abstract `build`(coord_: Tensor, atype_: Tensor, natoms: Tensor, box_: Tensor, mesh: Tensor, input_dict: Dict[str, Any], reuse: bool | None = None, suffix: str = "") → Tensor

Build the computational graph for the descriptor.

Parameters

`coord_`
[tf.Tensor] The coordinate of atoms

`atype_`
[tf.Tensor] The type of atoms

`natoms`
[tf.Tensor] The number of atoms. This tensor has the length of Ntypes + 2
natoms[0]: number of local atoms natoms[1]: total number of atoms held by this processor
natoms[i]: 2 ≤ i < Ntypes+2, number of type i atoms

`box_`
[tf.Tensor] The box of frames

`mesh`
[tf.Tensor] For historical reasons, only the length of the Tensor matters. if size of mesh == 6, pbc is assumed. if size of mesh == 0, no-pbc is assumed.

`input_dict`
[dict[str, Any]] Dictionary for additional inputs

`reuse`
[bool, optional] The weights in the networks should be reused when get the variable.

suffix
[`str`, `optional`] Name suffix to identify this descriptor

Returns

descriptor: `tf.Tensor`
The output descriptor

Notes

This method must be implemented, as it's called by other classes.

build_type_exclude_mask(exclude_types: `List[Tuple[int, int]]`, ntypes: `int`, sel: `List[int]`, ndescript: `int`, atype: `Tensor`, shape0: `Tensor`) → `Tensor`

Build the type exclude mask for the descriptor.

Parameters

exclude_types
[`List[Tuple[int, int]]`] The list of excluded types, e.g. [(0, 1), (1, 0)] means the interaction between type 0 and type 1 is excluded.

ntypes
[`int`] The number of types.

sel
[`List[int]`] The list of the number of selected neighbors for each type.

ndescript
[`int`] The number of descriptors for each atom.

atype
[`tf.Tensor`] The type of atoms, with the size of shape0.

shape0
[`tf.Tensor`] The shape of the first dimension of the inputs, which is equal to nsamples * natoms.

Returns

`tf.Tensor`
The type exclude mask, with the shape of (shape0, ndescript), and the precision of GLOBAL_TF_FLOAT_PRECISION. The mask has the value of 1 if the interaction between two types is not excluded, and 0 otherwise.

Notes

To exclude the interaction between two types, the derivative of energy with respect to distances (or angles) between two atoms should be zero[R08579741114c-1]_, i.e.

$$\forall i \in \text{type 1}, j \in \text{type 2}, \frac{\partial E}{\partial r_{ij}} = 0$$

When embedding networks between every two types are built, we can just remove that network. But when type_one_side is enabled, a network may be built for multiple pairs of types. In this case, we need to build a mask to exclude the interaction between two types.

The mask assumes the descriptors are sorted by neighbor type with the fixed number of given sel and each neighbor has the same number of descriptors (for example 4).

References

[1]

```
abstract compute_input_stats(data_coord: List[ndarray], data_box: List[ndarray], data_atype:
                             List[ndarray], natoms_vec: List[ndarray], mesh: List[ndarray],
                             input_dict: Dict[str, List[ndarray]]) → None
```

Compute the statistics (avg and std) of the training data. The input will be normalized by the statistics.

Parameters

data_coord
`[list[np.ndarray]]` The coordinates. Can be generated by `deepmd.model.model_stat.make_stat_input()`

data_box
`[list[np.ndarray]]` The box. Can be generated by `deepmd.model.model_stat.make_stat_input()`

data_atype
`[list[np.ndarray]]` The atom types. Can be generated by `deepmd.model.model_stat.make_stat_input()`

natoms_vec
`[list[np.ndarray]]` The vector for the number of atoms of the system and different types of atoms. Can be generated by `deepmd.model.model_stat.make_stat_input()`

mesh
`[list[np.ndarray]]` The mesh for neighbor searching. Can be generated by `deepmd.model.model_stat.make_stat_input()`

input_dict
`[dict[str, list[np.ndarray]]]` Dictionary for additional input

Notes

This method must be implemented, as it's called by other classes.

```
enable_compression(min_nbor_dist: float, graph: Graph, graph_def: GraphDef, table_extrapolate:
                    float = 5.0, table_stride_1: float = 0.01, table_stride_2: float = 0.1,
                    check_frequency: int = -1, suffix: str = '') → None
```

Reveive the statistics (distance, max_nbor_size and env_mat_range) of the training data.

Parameters

min_nbor_dist
`[float]` The nearest distance between atoms

graph
`[tf.Graph]` The graph of the model

graph_def
`[tf.GraphDef]` The graph definition of the model

table_extrapolate
`[float, default: 5.]` The scale of model extrapolation

`table_stride_1`
 [`float`, default: 0.01] The uniform stride of the first table
`table_stride_2`
 [`float`, default: 0.1] The uniform stride of the second table
`check_frequency`
 [`int`, default: -1] The overflow check frequency
`suffix`
 [`str`, optional] The suffix of the scope

Notes

This method is called by others when the descriptor supported compression.

enable_mixed_precision(mixed_prec: `dict` | `None` = `None`) → `None`

Reveive the mixed precision setting.

Parameters

`mixed_prec`
 The mixed precision setting used in the embedding net

Notes

This method is called by others when the descriptor supported compression.

abstract get_dim_out() → `int`

Returns the output dimension of this descriptor.

Returns

`int`
 the output dimension of this descriptor

Notes

This method must be implemented, as it's called by other classes.

get_dim_rot_mat_1() → `int`

Returns the first dimension of the rotation matrix. The rotation is of shape dim_1 x 3.

Returns

`int`
 the first dimension of the rotation matrix

get_feed_dict(coord_: `Tensor`, atype_: `Tensor`, natoms: `Tensor`, box: `Tensor`, mesh: `Tensor`) → `Dict`[`str`, `Tensor`]

Generate the feed_dict for current descriptor.

Parameters

`coord_`
 [`tf.Tensor`] The coordinate of atoms
`atype_`
 [`tf.Tensor`] The type of atoms

`natoms`
[`tf.Tensor`] The number of atoms. This tensor has the length of `Ntypes + 2`
`natoms[0]`: number of local atoms `natoms[1]`: total number of atoms held by this processor `natoms[i]`: $2 \leq i < Ntypes+2$, number of type `i` atoms

`box`
[`tf.Tensor`] The box. Can be generated by `deepmd.model.make_stat_input`

`mesh`
[`tf.Tensor`] For historical reasons, only the length of the Tensor matters. if size of `mesh == 6`, pbc is assumed. if size of `mesh == 0`, no-pbc is assumed.

Returns

`feed_dict`
[`dict[str, tf.Tensor]`] The output `feed_dict` of current descriptor

`get_nlist()` → `Tuple[Tensor, Tensor, List[int], List[int]]`

Returns neighbor information.

Returns

`nlist`
[`tf.Tensor`] Neighbor list

`rij`
[`tf.Tensor`] The relative distance between the neighbor and the center atom.

`sel_a`
[`list[int]`] The number of neighbors with full information

`sel_r`
[`list[int]`] The number of neighbors with only radial information

abstract `get_ntypes()` → `int`

Returns the number of atom types.

Returns

`int`
the number of atom types

Notes

This method must be implemented, as it's called by other classes.

abstract `get_rcut()` → `float`

Returns the cut-off radius.

Returns

`float`
the cut-off radius

Notes

This method must be implemented, as it's called by other classes.

get_tensor_names(suffix: str = '') → Tuple[str]

Get names of tensors.

Parameters

suffix
[str] The suffix of the scope

Returns

Tuple[str]
Names of tensors

init_variables(graph: Graph, graph_def: GraphDef, suffix: str = '') → None

Init the embedding net variables with the given dict.

Parameters

graph
[tf.Graph] The input frozen model graph
graph_def
[tf.GraphDef] The input frozen model graph_def
suffix
[str, optional] The suffix of the scope

Notes

This method is called by others when the descriptor supported initialization from the given variables.

pass_tensors_from_frz_model(*tensors: Tensor) → None

Pass the descrpt_reshape tensor as well as descrpt_deriv tensor from the frz graph_def.

Parameters

*tensors
[tf.Tensor] passed tensors

Notes

The number of parameters in the method must be equal to the numbers of returns in *get_tensor_names()*.

abstract prod_force_virial(atom_ener: Tensor, natoms: Tensor) → Tuple[Tensor, Tensor, Tensor]

Compute force and virial.

Parameters

atom_ener
[tf.Tensor] The atomic energy

natoms
 [tf.Tensor] The number of atoms. This tensor has the length of Ntypes + 2
 natoms[0]: number of local atoms natoms[1]: total number of atoms held by this
 processor natoms[i]: $2 \leq i < \text{Ntypes} + 2$, number of type i atoms

Returns

force
 [tf.Tensor] The force on atoms
 virial
 [tf.Tensor] The total virial
 atom_virial
 [tf.Tensor] The atomic virial

static register(key: str) → Descriptor

Register a descriptor plugin.

Parameters

key
 [str] the key of a descriptor

Returns

Descriptor
 the registered descriptor

Examples

```
>>> @Descriptor.register("some_descript")
class SomeDescript(Descriptor):
    pass
```

class deepmd.descriptor.DescriptHybrid(*args, **kwargs)

Bases: *Descriptor*

Concatenate a list of descriptors to form a new descriptor.

Parameters

list
 [list] Build a descriptor from the concatenation of the list of descriptors.

Methods

<code>build(coord_, atype_, natoms, box_, mesh, ...)</code>	Build the computational graph for the descriptor.
<code>build_type_exclude_mask(exclude_types, ...)</code>	Build the type exclude mask for the descriptor.
<code>compute_input_stats(data_coord, data_box, ...)</code>	Compute the statistics (avg and std) of the training data.
<code>enable_compression(min_nbor_dist, graph, ...)</code>	Reveive the statistics (distance, max_nbor_size and env_mat_range) of the training data.
<code>enable_mixed_precision([mixed_prec])</code>	Reveive the mixed precision setting.
<code>get_dim_out()</code>	Returns the output dimension of this descriptor.
<code>get_dim_rot_mat_1()</code>	Returns the first dimension of the rotation matrix.
<code>get_feed_dict(coord_, atype_, natoms, box, mesh)</code>	Generate the feed_dict for current descriptor.
<code>get_nlist()</code>	Get the neighbor information of the descriptor, returns the nlist of the descriptor with the largest cut-off radius.
<code>get_nlist_i(ii)</code>	Get the neighbor information of the ii-th descriptor.
<code>get_ntypes()</code>	Returns the number of atom types.
<code>get_rcut()</code>	Returns the cut-off radius.
<code>get_tensor_names([suffix])</code>	Get names of tensors.
<code>init_variables(graph, graph_def[, suffix])</code>	Init the embedding net variables with the given dict.
<code>merge_input_stats(stat_dict)</code>	Merge the statistics computed from compute_input_stats to obtain the self.davg and self.dstd.
<code>pass_tensors_from_frz_model(*tensors)</code>	Pass the descript_reshape tensor as well as descript_deriv tensor from the frz graph_def.
<code>prod_force_virial(atom_ener, natoms)</code>	Compute force and virial.
<code>register(key)</code>	Register a descriptor plugin.

`build(coord_: Tensor, atype_: Tensor, natoms: Tensor, box_: Tensor, mesh: Tensor, input_dict: dict, reuse: bool | None = None, suffix: str = '') → Tensor`

Build the computational graph for the descriptor.

Parameters

`coord_`
The coordinate of atoms

`atype_`
The type of atoms

`natoms`
The number of atoms. This tensor has the length of Ntypes + 2 `natoms[0]`: number of local atoms `natoms[1]`: total number of atoms held by this processor `natoms[i]`: $2 \leq i < \text{Ntypes} + 2$, number of type i atoms

`box_`
[`tf.Tensor`] The box of the system

`mesh`
For historical reasons, only the length of the Tensor matters. if size of mesh == 6,

pbc is assumed. if size of mesh == 0, no-pbc is assumed.

 input_dict

 Dictionary for additional inputs

 reuse

 The weights in the networks should be reused when get the variable.

 suffix

 Name suffix to identify this descriptor

Returns

descriptor

 The output descriptor

compute_input_stats(data_coord: list, data_box: list, data_atype: list, natoms_vec: list, mesh: list, input_dict: dict) → None

Compute the statisitcs (avg and std) of the training data. The input will be normalized by the statistics.

Parameters

 data_coord

 The coordinates. Can be generated by deepmd.model.make_stat_input

 data_box

 The box. Can be generated by deepmd.model.make_stat_input

 data_atype

 The atom types. Can be generated by deepmd.model.make_stat_input

 natoms_vec

 The vector for the number of atoms of the system and different types of atoms.
 Can be generated by deepmd.model.make_stat_input

 mesh

 The mesh for neighbor searching. Can be generated by
 deepmd.model.make_stat_input

 input_dict

 Dictionary for additional input

enable_compression(min_nbor_dist: float, graph: Graph, graph_def: GraphDef, table_extrapolate: float = 5.0, table_stride_1: float = 0.01, table_stride_2: float = 0.1, check_frequency: int = -1, suffix: str = '') → None

Reveive the statisitcs (distance, max_nbor_size and env_mat_range) of the training data.

Parameters

 min_nbor_dist

 [float] The nearest distance between atoms

 graph

 [tf.Graph] The graph of the model

 graph_def

 [tf.GraphDef] The graph_def of the model

 table_extrapolate

 [float, default: 5.] The scale of model extrapolation

`table_stride_1`
`[float, default: 0.01]` The uniform stride of the first table

`table_stride_2`
`[float, default: 0.1]` The uniform stride of the second table

`check_frequency`
`[int, default: -1]` The overflow check frequency

`suffix`
`[str, optional]` The suffix of the scope

`enable_mixed_precision`(mixed_prec: dict | None = None) → None
 Receive the mixed precision setting.

Parameters

`mixed_prec`
 The mixed precision setting used in the embedding net

`get_dim_out`() → int
 Returns the output dimension of this descriptor.

`get_nlist`() → Tuple[Tensor, Tensor, List[int], List[int]]
 Get the neighbor information of the descriptor, returns the nlist of the descriptor with the largest cut-off radius.

Returns

`nlist`
 Neighbor list

`rij`
 The relative distance between the neighbor and the center atom.

`sel_a`
 The number of neighbors with full information

`sel_r`
 The number of neighbors with only radial information

`get_nlist_i`(ii: int) → Tuple[Tensor, Tensor, List[int], List[int]]
 Get the neighbor information of the ii-th descriptor.

Parameters

`ii`
`[int]` The index of the descriptor

Returns

`nlist`
 Neighbor list

`rij`
 The relative distance between the neighbor and the center atom.

`sel_a`
 The number of neighbors with full information

`sel_r`
 The number of neighbors with only radial information

`get_ntypes()` → `int`

Returns the number of atom types.

`get_rcut()` → `float`

Returns the cut-off radius.

`get_tensor_names(suffix: str = '')` → `Tuple[str]`

Get names of tensors.

Parameters

suffix

[`str`] The suffix of the scope

Returns

`Tuple[str]`

Names of tensors

`init_variables(graph: Graph, graph_def: GraphDef, suffix: str = '')` → `None`

Init the embedding net variables with the given dict.

Parameters

graph

[`tf.Graph`] The input frozen model graph

graph_def

[`tf.GraphDef`] The input frozen model graph_def

suffix

[`str`, `optional`] The suffix of the scope

`merge_input_stats(stat_dict)`

Merge the statistics computed from `compute_input_stats` to obtain the `self.davg` and `self.dstd`.

Parameters

stat_dict

The dict of statistics computed from `compute_input_stats`, including:

sumr

The sum of radial statistics.

suma

The sum of relative coord statistics.

sumn

The sum of neighbor numbers.

sumr2

The sum of square of radial statistics.

suma2

The sum of square of relative coord statistics.

`pass_tensors_from_frz_model(*tensors: Tensor)` → `None`

Pass the `descript_reshape` tensor as well as `descript_deriv` tensor from the `frz_graph_def`.

Parameters

```

    *tensors
    [tf.Tensor] passed tensors
prod_force_virial(atom_ener: Tensor, natoms: Tensor) → Tuple[Tensor, Tensor, Tensor]
    Compute force and virial.

    Parameters
        atom_ener
            The atomic energy

        natoms
            The number of atoms. This tensor has the length of Ntypes + 2
            natoms[0]: number of local atoms
            natoms[1]: total number of atoms held by this processor
            natoms[i]: 2 ≤ i < Ntypes+2, number of type i atoms

    Returns
        force
            The force on atoms

        virial
            The total virial

        atom_virial
            The atomic virial

class deepmd.descriptor.DescriptLocFrame(*args, **kwargs)
    Bases: Descriptor

    Defines a local frame at each atom, and the compute the descriptor as local coordinates under this frame.

    Parameters
        rcut
            The cut-off radius

        sel_a
            [list[str]] The length of the list should be the same as the number of atom types in the system. sel_a[i] gives the selected number of type-i neighbors. The full relative coordinates of the neighbors are used by the descriptor.

        sel_r
            [list[str]] The length of the list should be the same as the number of atom types in the system. sel_r[i] gives the selected number of type-i neighbors. Only relative distance of the neighbors are used by the descriptor. sel_a[i] + sel_r[i] is recommended to be larger than the maximally possible number of type-i neighbors in the cut-off radius.

        axis_rule: list[int]
            The length should be 6 times of the number of types.
            - axis_rule[i*6+0]: class of the atom defining the first axis of type-i atom. 0 for neighbors with full coordinates and 1 for neighbors only with relative distance.
            - axis_rule[i*6+1]: type of the atom defining the first axis of type-i atom.
            - axis_rule[i*6+2]: index of the axis atom defining the first axis. Note that the neighbors with the same class and type are sorted according to their relative distance.
            - axis_rule[i*6+3]: class of the atom defining the second axis of type-i atom. 0 for neighbors with full coordinates and 1 for neighbors only with relative distance.
            - axis_rule[i*6+4]: type of the atom defining the second axis of type-i atom.
            - axis_rule[i*6+5]: index of the axis atom defining the second

```

axis. Note that the neighbors with the same class and type are sorted according to their relative distance.

Methods

<code>build(coord_, atype_, natoms, box_, mesh, ...)</code>	Build the computational graph for the descriptor.
<code>build_type_exclude_mask(exclude_types, ...)</code>	Build the type exclude mask for the descriptor.
<code>compute_input_stats(data_coord, data_box, ...)</code>	Compute the statistics (avg and std) of the training data.
<code>enable_compression(min_nbor_dist, graph, ...)</code>	Reveive the statistics (distance, max_nbor_size and env_mat_range) of the training data.
<code>enable_mixed_precision([mixed_prec])</code>	Reveive the mixed precision setting.
<code>get_dim_out()</code>	Returns the output dimension of this descriptor.
<code>get_dim_rot_mat_1()</code>	Returns the first dimension of the rotation matrix.
<code>get_feed_dict(coord_, atype_, natoms, box, mesh)</code>	Generate the feed_dict for current descriptor.
<code>get_nlist()</code>	Returns
<code>get_ntypes()</code>	Returns the number of atom types.
<code>get_rcut()</code>	Returns the cut-off radius.
<code>get_rot_mat()</code>	Get rotational matrix.
<code>get_tensor_names([suffix])</code>	Get names of tensors.
<code>init_variables(graph, graph_def[, suffix])</code>	Init the embedding net variables with the given dict.
<code>pass_tensors_from_frz_model(*tensors)</code>	Pass the descript_reshape tensor as well as descript_deriv tensor from the frz graph_def.
<code>prod_force_virial(atom_ener, natoms)</code>	Compute force and virial.
<code>register(key)</code>	Register a descriptor plugin.

build(coord_: Tensor, atype_: Tensor, natoms: Tensor, box_: Tensor, mesh: Tensor, input_dict: dict, reuse: bool | None = None, suffix: str = '') → Tensor

Build the computational graph for the descriptor.

Parameters

coord_
The coordinate of atoms

atype_
The type of atoms

natoms
The number of atoms. This tensor has the length of Ntypes + 2 natoms[0]: number of local atoms natoms[1]: total number of atoms held by this processor natoms[i]: 2 ≤ i < Ntypes+2, number of type i atoms

box_
[tf.Tensor] The box of the system

mesh
For historical reasons, only the length of the Tensor matters. if size of mesh == 6, pbc is assumed. if size of mesh == 0, no-pbc is assumed.

`input_dict`
 Dictionary for additional inputs

`reuse`
 The weights in the networks should be reused when get the variable.

`suffix`
 Name suffix to identify this descriptor

Returns

descriptor
 The output descriptor

`compute_input_stats(data_coord: list, data_box: list, data_atype: list, natoms_vec: list, mesh: list, input_dict: dict) → None`

Compute the statisitcs (avg and std) of the training data. The input will be normalized by the statistics.

Parameters

`data_coord`
 The coordinates. Can be generated by `deepmd.model.make_stat_input`

`data_box`
 The box. Can be generated by `deepmd.model.make_stat_input`

`data_atype`
 The atom types. Can be generated by `deepmd.model.make_stat_input`

`natoms_vec`
 The vector for the number of atoms of the system and different types of atoms.
 Can be generated by `deepmd.model.make_stat_input`

`mesh`
 The mesh for neighbor searching. Can be generated by `deepmd.model.make_stat_input`

`input_dict`
 Dictionary for additional input

`get_dim_out() → int`

Returns the output dimension of this descriptor.

`get_nlist() → Tuple[Tensor, Tensor, List[int], List[int]]`

Returns

`nlist`
 Neighbor list

`rij`
 The relative distance between the neighbor and the center atom.

`sel_a`
 The number of neighbors with full information

`sel_r`
 The number of neighbors with only radial information

`get_ntypes() → int`

Returns the number of atom types.

`get_rcut()` → float

Returns the cut-off radius.

`get_rot_mat()` → Tensor

Get rotational matrix.

`init_variables(graph: Graph, graph_def: GraphDef, suffix: str = '')` → None

Init the embedding net variables with the given dict.

Parameters

`graph`

[tf.Graph] The input frozen model graph

`graph_def`

[tf.GraphDef] The input frozen model graph_def

`suffix`

[str, optional] The suffix of the scope

`prod_force_virial(atom_ener: Tensor, natoms: Tensor)` → Tuple[Tensor, Tensor, Tensor]

Compute force and virial.

Parameters

`atom_ener`

The atomic energy

`natoms`

The number of atoms. This tensor has the length of Ntypes + 2 natoms[0]: number of local atoms natoms[1]: total number of atoms held by this processor natoms[i]: 2 ≤ i < Ntypes+2, number of type i atoms

Returns

force

The force on atoms

virial

The total virial

atom_virial

The atomic virial

`class deepmd.descriptor.DescriptSeA(*args, **kwargs)`

Bases: *DescriptSe*

DeepPot-SE constructed from all information (both angular and radial) of atomic configurations. The embedding takes the distance between atoms as input.

The descriptor $\mathcal{D}^i \in \mathbb{R}^{M_1 \times M_2}$ is given by [1]

$$\mathcal{D}^i = (\mathcal{G}^i)^T \mathcal{R}^i (\mathcal{R}^i)^T \mathcal{G}_{<}^i$$

where $\mathcal{R}^i \in \mathbb{R}^{N \times 4}$ is the coordinate matrix, and each row of \mathcal{R}^i can be constructed as follows

$$(\mathcal{R}^i)_j = \begin{bmatrix} \frac{s(r_{ji})}{s(r_{ji})x_{ji}} \\ \frac{r_{ji}^2}{s(r_{ji})y_{ji}} \\ \frac{r_{ji}^2}{s(r_{ji})z_{ji}} \\ \frac{r_{ji}^2}{r_{ji}} \end{bmatrix}$$

where $\mathbf{R}_{ji} = \mathbf{R}_j - \mathbf{R}_i = (x_{ji}, y_{ji}, z_{ji})$ is the relative coordinate and $r_{ji} = \|\mathbf{R}_{ji}\|$ is its norm. The switching function $s(r)$ is defined as:

$$s(r) = \begin{cases} \frac{1}{r}, & r < r_s \\ \frac{1}{r} \left\{ \left(\frac{r-r_s}{r_c-r_s} \right)^3 \left(-6 \left(\frac{r-r_s}{r_c-r_s} \right)^2 + 15 \frac{r-r_s}{r_c-r_s} - 10 \right) + 1 \right\}, & r_s \leq r < r_c \\ 0, & r \geq r_c \end{cases}$$

Each row of the embedding matrix $\mathcal{G}^i \in \mathbb{R}^{N \times M_1}$ consists of outputs of a embedding network \mathcal{N} of $s(r_{ji})$:

$$(\mathcal{G}^i)_j = \mathcal{N}(s(r_{ji}))$$

$\mathcal{G}^i_{<} \in \mathbb{R}^{N \times M_2}$ takes first M_2 columns of \mathcal{G}^i . The equation of embedding network \mathcal{N} can be found at [deepmd.utils.network.embedding_net\(\)](#).

Parameters

- rcut
The cut-off radius r_c
- rcut_smth
From where the environment matrix should be smoothed r_s
- sel
[[list](#)[[str](#)]] sel[i] specifies the maximum number of type i atoms in the cut-off radius
- neuron
[[list](#)[[int](#)]] Number of neurons in each hidden layers of the embedding net \mathcal{N}
- axis_neuron
Number of the axis neuron M_2 (number of columns of the sub-matrix of the embedding matrix)
- resnet_dt
Time-step dt in the resnet construction: $y = x + dt * \phi(Wx + b)$
- trainable
If the weights of embedding net are trainable.
- seed
Random seed for initializing the network parameters.
- type_one_side
Try to build N_types embedding nets. Otherwise, building N_types^2 embedding nets
- exclude_types
[[List](#)[[List](#)[[int](#)]]] The excluded pairs of types which have no interaction with each other. For example, [\[\[0, 1\]\]](#) means no interaction between type 0 and type 1.
- set_davg_zero
Set the shift of embedding net input to zero.
- activation_function
The activation function in the embedding net. Supported options are “relu”, “relu6”, “softplus”, “sigmoid”, “tanh”, “gelu”, “gelu_tf”, “None”, “none”.
- precision
The precision of the embedding net parameters. Supported options are “default”, “float16”, “float32”, “float64”, “bfloat16”.

- `uniform_seed`
Only for the purpose of backward compatibility, retrieves the old behavior of using the random seed
- `multi_task`
If the model has multi fitting nets to train.

References

[1]

Attributes

- precision**
Precision of filter network.

Methods

<code>build(coord_, atype_, natoms, box_, mesh, ...)</code>	Build the computational graph for the descriptor.
<code>build_type_exclude_mask(exclude_types, ...)</code>	Build the type exclude mask for the descriptor.
<code>compute_input_stats(data_coord, data_box, ...)</code>	Compute the statisitcs (avg and std) of the training data.
<code>enable_compression(min_nbor_dist, graph, ...)</code>	Reveive the statisitcs (distance, max_nbor_size and env_mat_range) of the training data.
<code>enable_mixed_precision([mixed_prec])</code>	Reveive the mixed precision setting.
<code>get_dim_out()</code>	Returns the output dimension of this descriptor.
<code>get_dim_rot_mat_1()</code>	Returns the first dimension of the rotation matrix.
<code>get_feed_dict(coord_, atype_, natoms, box, mesh)</code>	Generate the feed_dict for current descriptor.
<code>get_nlist()</code>	Returns
<code>get_ntypes()</code>	Returns the number of atom types.
<code>get_rcut()</code>	Returns the cut-off radius.
<code>get_rot_mat()</code>	Get rotational matrix.
<code>get_tensor_names([suffix])</code>	Get names of tensors.
<code>init_variables(graph, graph_def[, suffix])</code>	Init the embedding net variables with the given dict.
<code>merge_input_stats(stat_dict)</code>	Merge the statisitcs computed from compute_input_stats to obtain the self.davg and self.dstd.
<code>pass_tensors_from_frz_model(descrpt_reshape ...)</code>	Pass the descrpt_reshape tensor as well as descrpt_deriv tensor from the frz graph_def.
<code>prod_force_virial(atom_ener, natoms)</code>	Compute force and virial.
<code>register(key)</code>	Register a descriptor plugin.

build(coord_: Tensor, atype_: Tensor, natoms: Tensor, box_: Tensor, mesh: Tensor, input_dict: dict, reuse: bool | None = None, suffix: str = '') → Tensor

Build the computational graph for the descriptor.

Parameters

`coord_`
The coordinate of atoms

`atype_`
The type of atoms

`natoms`
The number of atoms. This tensor has the length of `Ntypes + 2` `natoms[0]`: number of local atoms `natoms[1]`: total number of atoms held by this processor `natoms[i]`: $2 \leq i < Ntypes+2$, number of type `i` atoms

`box_`
[`tf.Tensor`] The box of the system

`mesh`
For historical reasons, only the length of the Tensor matters. if size of `mesh == 6`, pbc is assumed. if size of `mesh == 0`, no-pbc is assumed.

`input_dict`
Dictionary for additional inputs

`reuse`
The weights in the networks should be reused when get the variable.

`suffix`
Name suffix to identify this descriptor

Returns

descriptor
The output descriptor

`compute_input_stats`(`data_coord`: list, `data_box`: list, `data_atype`: list, `natoms_vec`: list, `mesh`: list, `input_dict`: dict) → None

Compute the statistics (avg and std) of the training data. The input will be normalized by the statistics.

Parameters

`data_coord`
The coordinates. Can be generated by `deepmd.model.make_stat_input`

`data_box`
The box. Can be generated by `deepmd.model.make_stat_input`

`data_atype`
The atom types. Can be generated by `deepmd.model.make_stat_input`

`natoms_vec`
The vector for the number of atoms of the system and different types of atoms. Can be generated by `deepmd.model.make_stat_input`

`mesh`
The mesh for neighbor searching. Can be generated by `deepmd.model.make_stat_input`

`input_dict`
Dictionary for additional input

`enable_compression`(`min_nbor_dist`: float, `graph`: Graph, `graph_def`: GraphDef, `table_extrapolate`: float = 5, `table_stride_1`: float = 0.01, `table_stride_2`: float = 0.1, `check_frequency`: int = -1, `suffix`: str = '') → None

Reveive the statisitcs (distance, max_nbor_size and env_mat_range) of the training data.

Parameters

min_nbor_dist
The nearest distance between atoms

graph
[[tf.Graph](#)] The graph of the model

graph_def
[[tf.GraphDef](#)] The graph_def of the model

table_extrapolate
The scale of model extrapolation

table_stride_1
The uniform stride of the first table

table_stride_2
The uniform stride of the second table

check_frequency
The overflow check frequency

suffix
[[str](#), optional] The suffix of the scope

enable_mixed_precision(mixed_prec: [dict](#) | [None](#) = [None](#)) → [None](#)

Reveive the mixed precision setting.

Parameters

mixed_prec
The mixed precision setting used in the embedding net

get_dim_out() → [int](#)

Returns the output dimension of this descriptor.

get_dim_rot_mat_1() → [int](#)

Returns the first dimension of the rotation matrix. The rotation is of shape dim_1 x 3.

get_nlist() → [Tuple](#)[[Tensor](#), [Tensor](#), [List](#)[[int](#)], [List](#)[[int](#)]]

Returns

nlist
Neighbor list

rij
The relative distance between the neighbor and the center atom.

sel_a
The number of neighbors with full information

sel_r
The number of neighbors with only radial information

get_ntypes() → [int](#)

Returns the number of atom types.

`get_rcut()` → float

Returns the cut-off radius.

`get_rot_mat()` → Tensor

Get rotational matrix.

`init_variables(graph: Graph, graph_def: GraphDef, suffix: str = '')` → None

Init the embedding net variables with the given dict.

Parameters

`graph`

[tf.Graph] The input frozen model graph

`graph_def`

[tf.GraphDef] The input frozen model graph_def

`suffix`

[str, optional] The suffix of the scope

`merge_input_stats(stat_dict)`

Merge the statistics computed from `compute_input_stats` to obtain the `self.davg` and `self.dstd`.

Parameters

`stat_dict`

The dict of statistics computed from `compute_input_stats`, including:

`sumr`

The sum of radial statistics.

`suma`

The sum of relative coord statistics.

`sumn`

The sum of neighbor numbers.

`sumr2`

The sum of square of radial statistics.

`suma2`

The sum of square of relative coord statistics.

`prod_force_virial(atom_ener: Tensor, natoms: Tensor)` → Tuple[Tensor, Tensor, Tensor]

Compute force and virial.

Parameters

`atom_ener`

The atomic energy

`natoms`

The number of atoms. This tensor has the length of `Ntypes + 2` `natoms[0]`: number of local atoms `natoms[1]`: total number of atoms held by this processor `natoms[i]`: $2 \leq i < Ntypes+2$, number of type `i` atoms

Returns

`force`

The force on atoms

```
    virial
        The total virial
    atom_virial
        The atomic virial
class deepmd.descriptor.DescriptSeAEbd(*args, **kwargs)
    Bases: DescriptSeA
    DeepPot-SE descriptor with type embedding approach.
    Parameters
    rcut
        The cut-off radius
    rcut_smth
        From where the environment matrix should be smoothed
    sel
        [list[str]] sel[i] specifies the maximum number of type i atoms in the cut-off radius
    neuron
        [list[int]] Number of neurons in each hidden layers of the embedding net
    axis_neuron
        Number of the axis neuron (number of columns of the sub-matrix of the embedding matrix)
    resnet_dt
        Time-step dt in the resnet construction:  $y = x + dt * \phi(Wx + b)$ 
    trainable
        If the weights of embedding net are trainable.
    seed
        Random seed for initializing the network parameters.
    type_one_side
        Try to build  $N_{types}$  embedding nets. Otherwise, building  $N_{types}^2$  embedding nets
    type_nchanl
        Number of channels for type representation
    type_nlayer
        Number of hidden layers for the type embedding net (skip connected).
    numb_aparam
        Number of atomic parameters. If  $>0$  it will be embedded with atom types.
    set_davg_zero
        Set the shift of embedding net input to zero.
    activation_function
        The activation function in the embedding net. Supported options are {0}
    precision
        The precision of the embedding net parameters. Supported options are {1}
    exclude_types
        [List[List[int]]] The excluded pairs of types which have no interaction with each other. For example,  $[[0, 1]]$  means no interaction between type 0 and type 1.
```

Attributes

precision

Precision of filter network.

Methods

<code>build(coord_, atype_, natoms, box_, mesh, ...)</code>	Build the computational graph for the descriptor.
<code>build_type_exclude_mask(exclude_types, ...)</code>	Build the type exclude mask for the descriptor.
<code>compute_input_stats(data_coord, data_box, ...)</code>	Compute the statisitcs (avg and std) of the training data.
<code>enable_compression(min_nbor_dist, graph, ...)</code>	Reveive the statisitcs (distance, max_nbor_size and env_mat_range) of the training data.
<code>enable_mixed_precision([mixed_prec])</code>	Reveive the mixed precision setting.
<code>get_dim_out()</code>	Returns the output dimension of this descriptor.
<code>get_dim_rot_mat_1()</code>	Returns the first dimension of the rotation matrix.
<code>get_feed_dict(coord_, atype_, natoms, box, mesh)</code>	Generate the feed_dict for current descriptor.
<code>get_nlist()</code>	Returns
<code>get_ntypes()</code>	Returns the number of atom types.
<code>get_rcut()</code>	Returns the cut-off radius.
<code>get_rot_mat()</code>	Get rotational matrix.
<code>get_tensor_names([suffix])</code>	Get names of tensors.
<code>init_variables(graph, graph_def[, suffix])</code>	Init the embedding net variables with the given dict.
<code>merge_input_stats(stat_dict)</code>	Merge the statisitcs computed from compute_input_stats to obtain the self.davg and self.dstd.
<code>pass_tensors_from_frz_model(descrpt_reshape ...)</code>	Pass the descrpt_reshape tensor as well as descrpt_deriv tensor from the frz graph_def.
<code>prod_force_virial(atom_ener, natoms)</code>	Compute force and virial.
<code>register(key)</code>	Register a descriptor plugin.

`build(coord_: Tensor, atype_: Tensor, natoms: Tensor, box_: Tensor, mesh: Tensor, input_dict: dict, reuse: bool | None = None, suffix: str = '') → Tensor`

Build the computational graph for the descriptor.

Parameters

`coord_`

The coordinate of atoms

`atype_`

The type of atoms

`natoms`

The number of atoms. This tensor has the length of Ntypes + 2 `natoms[0]`: number of local atoms `natoms[1]`: total number of atoms held by this processor `natoms[i]`: $2 \leq i < \text{Ntypes} + 2$, number of type *i* atoms

`box_`
[`tf.Tensor`] The box of the system

`mesh`
For historical reasons, only the length of the Tensor matters. if size of mesh == 6, pbc is assumed. if size of mesh == 0, no-pbc is assumed.

`input_dict`
Dictionary for additional inputs

`reuse`
The weights in the networks should be reused when get the variable.

`suffix`
Name suffix to identify this descriptor

Returns

descriptor
The output descriptor

`class deepmd.descriptor.DescriptSeAEf(*args, **kwargs)`

Bases: *Descriptor*

Smooth edition descriptor with Ef.

Parameters

`rcut`
The cut-off radius

`rcut_smth`
From where the environment matrix should be smoothed

`sel`
[`list[str]`] `sel[i]` specifies the maximum number of type `i` atoms in the cut-off radius

`neuron`
[`list[int]`] Number of neurons in each hidden layers of the embedding net

`axis_neuron`
Number of the axis neuron (number of columns of the sub-matrix of the embedding matrix)

`resnet_dt`
Time-step `dt` in the resnet construction: $y = x + dt * \phi(Wx + b)$

`trainable`
If the weights of embedding net are trainable.

`seed`
Random seed for initializing the network parameters.

`type_one_side`
Try to build `N_types` embedding nets. Otherwise, building `N_types^2` embedding nets

`exclude_types`
[`list[list[int]]`] The excluded pairs of types which have no interaction with each other. For example, `[[0, 1]]` means no interaction between type 0 and type 1.

`set_davg_zero`
Set the shift of embedding net input to zero.

activation_function

The activation function in the embedding net. Supported options are “relu”, “relu6”, “softplus”, “sigmoid”, “tanh”, “gelu”, “gelu_tf”, “None”, “none”.

precision

The precision of the embedding net parameters. Supported options are “default”, “float16”, “float32”, “float64”, “bfloat16”.

uniform_seed

Only for the purpose of backward compatibility, retrieves the old behavior of using the random seed

Methods

<i>build</i> (coord_, atype_, natoms, box_, mesh, ...)	Build the computational graph for the descriptor.
<i>build_type_exclude_mask</i> (exclude_types, ...)	Build the type exclude mask for the descriptor.
<i>compute_input_stats</i> (data_coord, data_box, ...)	Compute the statistics (avg and std) of the training data.
<i>enable_compression</i> (min_nbor_dist, graph, ...)	Reveive the statistics (distance, max_nbor_size and env_mat_range) of the training data.
<i>enable_mixed_precision</i> ([mixed_prec])	Reveive the mixed precision setting.
<i>get_dim_out</i> ()	Returns the output dimension of this descriptor.
<i>get_dim_rot_mat_1</i> ()	Returns the first dimension of the rotation matrix.
<i>get_feed_dict</i> (coord_, atype_, natoms, box, mesh)	Generate the feed_dict for current descriptor.
<i>get_nlist</i> ()	Returns
<i>get_ntypes</i> ()	Returns the number of atom types.
<i>get_rcut</i> ()	Returns the cut-off radius.
<i>get_rot_mat</i> ()	Get rotational matrix.
<i>get_tensor_names</i> ([suffix])	Get names of tensors.
<i>init_variables</i> (graph, graph_def[, suffix])	Init the embedding net variables with the given dict.
<i>pass_tensors_from_frz_model</i> (*tensors)	Pass the descript_reshape tensor as well as descript_deriv tensor from the frz graph_def.
<i>prod_force_virial</i> (atom_ener, natoms)	Compute force and virial.
<i>register</i> (key)	Register a descriptor plugin.

build(coord_: Tensor, atype_: Tensor, natoms: Tensor, box_: Tensor, mesh: Tensor, input_dict: dict, reuse: bool | None = None, suffix: str = '') → Tensor

Build the computational graph for the descriptor.

Parameters**coord_**

The coordinate of atoms

atype_

The type of atoms

natoms

The number of atoms. This tensor has the length of Ntypes + 2 natoms[0]: number

of local atoms `natoms[1]`: total number of atoms held by this processor `natoms[i]`:
 $2 \leq i < Ntypes+2$, number of type i atoms

`box_`
`[tf.Tensor]` The box of the system

`mesh`
 For historical reasons, only the length of the Tensor matters. if size of `mesh == 6`,
 pbc is assumed. if size of `mesh == 0`, no-pbc is assumed.

`input_dict`
 Dictionary for additional inputs. Should have 'efield'.

`reuse`
 The weights in the networks should be reused when get the variable.

`suffix`
 Name suffix to identify this descriptor

Returns

descriptor
 The output descriptor

compute_input_stats(data_coord: list, data_box: list, data_atype: list, natoms_vec: list, mesh: list,
input_dict: dict) → None

Compute the statistics (avg and std) of the training data. The input will be normalized by the
statistics.

Parameters

`data_coord`
 The coordinates. Can be generated by `deepmd.model.make_stat_input`

`data_box`
 The box. Can be generated by `deepmd.model.make_stat_input`

`data_atype`
 The atom types. Can be generated by `deepmd.model.make_stat_input`

`natoms_vec`
 The vector for the number of atoms of the system and different types of atoms.
 Can be generated by `deepmd.model.make_stat_input`

`mesh`
 The mesh for neighbor searching. Can be generated by
`deepmd.model.make_stat_input`

`input_dict`
 Dictionary for additional input

get_dim_out() → int
 Returns the output dimension of this descriptor.

get_dim_rot_mat_1() → int
 Returns the first dimension of the rotation matrix. The rotation is of shape `dim_1 x 3`.

get_nlist() → Tuple[Tensor, Tensor, List[int], List[int]]

Returns

nlist
 Neighbor list

```

    rij
        The relative distance between the neighbor and the center atom.

    sel_a
        The number of neighbors with full information

    sel_r
        The number of neighbors with only radial information

get_ntypes() → int
    Returns the number of atom types.

get_rcut() → float
    Returns the cut-off radius.

get_rot_mat() → Tensor
    Get rotational matrix.

prod_force_virial(atom_ener: Tensor, natoms: Tensor) → Tuple[Tensor, Tensor, Tensor]
    Compute force and virial.

    Parameters

    atom_ener
        The atomic energy

    natoms
        The number of atoms. This tensor has the length of Ntypes + 2 natoms[0]: number
        of local atoms natoms[1]: total number of atoms held by this processor natoms[i]:
        2 ≤ i < Ntypes+2, number of type i atoms

    Returns

    force
        The force on atoms

    virial
        The total virial

    atom_virial
        The atomic virial

class deepmd.descriptor.DescriptSeAEfLower(*args, **kwargs)
    Bases: DescriptSeA

    Helper class for implementing DescriptSeAEf.

    Attributes

    precision
        Precision of filter network.

```

Methods

<code>build(coord_, atype_, natoms, box_, mesh, ...)</code>	Build the computational graph for the descriptor.
<code>build_type_exclude_mask(exclude_types, ...)</code>	Build the type exclude mask for the descriptor.
<code>compute_input_stats(data_coord, data_box, ...)</code>	Compute the statistics (avg and std) of the training data.
<code>enable_compression(min_nbor_dist, graph, ...)</code>	Reveive the statistics (distance, max_nbor_size and env_mat_range) of the training data.
<code>enable_mixed_precision([mixed_prec])</code>	Reveive the mixed precision setting.
<code>get_dim_out()</code>	Returns the output dimension of this descriptor.
<code>get_dim_rot_mat_1()</code>	Returns the first dimension of the rotation matrix.
<code>get_feed_dict(coord_, atype_, natoms, box, mesh)</code>	Generate the feed_dict for current descriptor.
<code>get_nlist()</code>	Returns
<code>get_ntypes()</code>	Returns the number of atom types.
<code>get_rcut()</code>	Returns the cut-off radius.
<code>get_rot_mat()</code>	Get rotational matrix.
<code>get_tensor_names([suffix])</code>	Get names of tensors.
<code>init_variables(graph, graph_def[, suffix])</code>	Init the embedding net variables with the given dict.
<code>merge_input_stats(stat_dict)</code>	Merge the statistics computed from compute_input_stats to obtain the self.davg and self.dstd.
<code>pass_tensors_from_frz_model(descrpt_reshape ...)</code>	Pass the descrpt_reshape tensor as well as descrpt_deriv tensor from the frz graph_def.
<code>prod_force_virial(atom_ener, natoms)</code>	Compute force and virial.
<code>register(key)</code>	Register a descriptor plugin.

`build(coord_, atype_, natoms, box_, mesh, input_dict, suffix='', reuse=None)`

Build the computational graph for the descriptor.

Parameters

`coord_`

The coordinate of atoms

`atype_`

The type of atoms

`natoms`

The number of atoms. This tensor has the length of Ntypes + 2
natoms[0]: number of local atoms
natoms[1]: total number of atoms held by this processor
natoms[i]: 2 ≤ i < Ntypes+2, number of type i atoms

`box_`

[`tf.Tensor`] The box of the system

`mesh`

For historical reasons, only the length of the Tensor matters. if size of mesh == 6, pbc is assumed. if size of mesh == 0, no-pbc is assumed.

`input_dict`
 Dictionary for additional inputs

`reuse`
 The weights in the networks should be reused when get the variable.

`suffix`
 Name suffix to identify this descriptor

Returns

descriptor
 The output descriptor

compute_input_stats(data_coord, data_box, data_atype, natoms_vec, mesh, input_dict)
 Compute the statisitcs (avg and std) of the training data. The input will be normalized by the statistics.

Parameters

`data_coord`
 The coordinates. Can be generated by `deepmd.model.make_stat_input`

`data_box`
 The box. Can be generated by `deepmd.model.make_stat_input`

`data_atype`
 The atom types. Can be generated by `deepmd.model.make_stat_input`

`natoms_vec`
 The vector for the number of atoms of the system and different types of atoms.
 Can be generated by `deepmd.model.make_stat_input`

`mesh`
 The mesh for neighbor searching. Can be generated by `deepmd.model.make_stat_input`

`input_dict`
 Dictionary for additional input

class `deepmd.descriptor.DescriptSeAMask`(*args, **kwargs)

Bases: *DescriptSeA*

DeepPot-SE constructed from all information (both angular and radial) of atomic configurations. The embedding takes the distance between atoms as input.

The descriptor $\mathcal{D}^i \in \mathbb{R}^{M_1 \times M_2}$ is given by [1]

$$\mathcal{D}^i = (\mathcal{G}^i)^T \mathcal{R}^i (\mathcal{R}^i)^T \mathcal{G}_{<}^i$$

where $\mathcal{R}^i \in \mathbb{R}^{N \times 4}$ is the coordinate matrix, and each row of \mathcal{R}^i can be constructed as follows

$$(\mathcal{R}^i)_j = \begin{bmatrix} \frac{s(r_{ji})}{r_{ji}} \\ \frac{s(r_{ji})x_{ji}}{r_{ji}^2} \\ \frac{s(r_{ji})y_{ji}}{r_{ji}^2} \\ \frac{s(r_{ji})z_{ji}}{r_{ji}^2} \end{bmatrix}$$

where $\mathbf{R}_{ji} = \mathbf{R}_j - \mathbf{R}_i = (x_{ji}, y_{ji}, z_{ji})$ is the relative coordinate and $r_{ji} = \|\mathbf{R}_{ji}\|$ is its norm. The switching

function $s(r)$ is defined as:

$$s(r) = \begin{cases} \frac{1}{r}, & r < r_s \\ \frac{1}{r} \left\{ \left(\frac{r-r_s}{r_c-r_s} \right)^3 \left(-6 \left(\frac{r-r_s}{r_c-r_s} \right)^2 + 15 \frac{r-r_s}{r_c-r_s} - 10 \right) + 1 \right\}, & r_s \leq r < r_c \\ 0, & r \geq r_c \end{cases}$$

Each row of the embedding matrix $\mathcal{G}^i \in \mathbb{R}^{N \times M_1}$ consists of outputs of a embedding network \mathcal{N} of $s(r_{ji})$:

$$(\mathcal{G}^i)_j = \mathcal{N}(s(r_{ji}))$$

$\mathcal{G}^i \in \mathbb{R}^{N \times M_2}$ takes first M_2 columns of \mathcal{G}^i . The equation of embedding network \mathcal{N} can be found at `deepmd.utils.network.embedding_net()`. Specially for descriptor `se_a_mask` is a concise implementation of `se_a`. The difference is that `se_a_mask` only considered a non-pbc system. And accept a mask matrix to indicate the atom i in frame j is a real atom or not. (1 means real atom, 0 means ghost atom) Thus `se_a_mask` can accept a variable number of atoms in a frame.

Parameters

- `sel`
[`list[str]`] `sel[i]` specifies the maximum number of type i atoms in the neighbor list.
- `neuron`
[`list[int]`] Number of neurons in each hidden layers of the embedding net \mathcal{N}
- `axis_neuron`
Number of the axis neuron M_2 (number of columns of the sub-matrix of the embedding matrix)
- `resnet_dt`
Time-step dt in the resnet construction: $y = x + dt * \phi(Wx + b)$
- `trainable`
If the weights of embedding net are trainable.
- `seed`
Random seed for initializing the network parameters.
- `type_one_side`
Try to build N_{types} embedding nets. Otherwise, building N_{types}^2 embedding nets
- `exclude_types`
[`List[List[int]]`] The excluded pairs of types which have no interaction with each other. For example, `[[0, 1]]` means no interaction between type 0 and type 1.
- `activation_function`
The activation function in the embedding net. Supported options are {0}
- `precision`
The precision of the embedding net parameters. Supported options are {1}
- `uniform_seed`
Only for the purpose of backward compatibility, retrieves the old behavior of using the random seed

Attributes

precision

Precision of filter network.

Methods

<code>build(coord_, atype_, natoms, box_, mesh, ...)</code>	Build the computational graph for the descriptor.
<code>build_type_exclude_mask(exclude_types, ...)</code>	Build the type exclude mask for the descriptor.
<code>compute_input_stats(data_coord, data_box, ...)</code>	Compute the statisitcs (avg and std) of the training data.
<code>enable_compression(min_nbor_dist, graph, ...)</code>	Reveive the statisitcs (distance, max_nbor_size and env_mat_range) of the training data.
<code>enable_mixed_precision([mixed_prec])</code>	Reveive the mixed precision setting.
<code>get_dim_out()</code>	Returns the output dimension of this descriptor.
<code>get_dim_rot_mat_1()</code>	Returns the first dimension of the rotation matrix.
<code>get_feed_dict(coord_, atype_, natoms, box, mesh)</code>	Generate the feed_dict for current descriptor.
<code>get_nlist()</code>	Returns
<code>get_ntypes()</code>	Returns the number of atom types.
<code>get_rcut()</code>	Returns the cutoff radius.
<code>get_rot_mat()</code>	Get rotational matrix.
<code>get_tensor_names([suffix])</code>	Get names of tensors.
<code>init_variables(graph, graph_def[, suffix])</code>	Init the embedding net variables with the given dict.
<code>merge_input_stats(stat_dict)</code>	Merge the statisitcs computed from compute_input_stats to obtain the self.davg and self.dstd.
<code>pass_tensors_from_frz_model(descrpt_reshape ...)</code>	Pass the descrpt_reshape tensor as well as descrpt_deriv tensor from the frz graph_def.
<code>prod_force_virial(atom_ener, natoms)</code>	Compute force and virial.
<code>register(key)</code>	Register a descriptor plugin.

build(coord_: Tensor, atype_: Tensor, natoms: Tensor, box_: Tensor, mesh: Tensor, input_dict: Dict[str, Any], reuse: bool | None = None, suffix: str = "") → Tensor

Build the computational graph for the descriptor.

Parameters

coord_

The coordinate of atoms

atype_

The type of atoms

natoms

The number of atoms. This tensor has the length of Ntypes + 2 natoms[0]: number

of local atoms `natoms[1]`: total number of atoms held by this processor `natoms[i]`:
 $2 \leq i < \text{Ntypes} + 2$, number of type i atoms

`box_`
`[tf.Tensor]` The box of the system

`mesh`
 For historical reasons, only the length of the Tensor matters. if size of `mesh == 6`,
 pbc is assumed. if size of `mesh == 0`, no-pbc is assumed.

`input_dict`
 Dictionary for additional inputs

`reuse`
 The weights in the networks should be reused when get the variable.

`suffix`
 Name suffix to identify this descriptor

Returns

descriptor
 The output descriptor

compute_input_stats(`data_coord`: list, `data_box`: list, `data_atype`: list, `natoms_vec`: list, `mesh`: list,
`input_dict`: dict) → None

Compute the statistics (avg and std) of the training data. The input will be normalized by the
 statistics.

Parameters

`data_coord`
 The coordinates. Can be generated by `deepmd.model.make_stat_input`

`data_box`
 The box. Can be generated by `deepmd.model.make_stat_input`

`data_atype`
 The atom types. Can be generated by `deepmd.model.make_stat_input`

`natoms_vec`
 The vector for the number of atoms of the system and different types of atoms.
 Can be generated by `deepmd.model.make_stat_input`

`mesh`
 The mesh for neighbor searching. Can be generated by
`deepmd.model.make_stat_input`

`input_dict`
 Dictionary for additional input

get_rcut() → float

Returns the cutoff radius.

prod_force_virial(`atom_ener`: Tensor, `natoms`: Tensor) → Tuple[Tensor, Tensor, Tensor]

Compute force and virial.

Parameters

`atom_ener`
 The atomic energy

natoms

The number of atoms. This tensor has the length of $N_{\text{types}} + 2$ `natoms[0]`: number of local atoms `natoms[1]`: total number of atoms held by this processor `natoms[i]`: $2 \leq i < N_{\text{types}} + 2$, number of type i atoms

Returns

force

The force on atoms

virial

None for `se_a_mask` op

atom_virial

None for `se_a_mask` op

class `deepmd.descriptor.DescriptSeAtten(*args, **kwargs)`

Bases: *DescriptSeA*

Smooth version descriptor with attention.

Parameters

rcut

The cut-off radius r_c

rcut_smth

From where the environment matrix should be smoothed r_s

sel

`[list[str]]` `sel[i]` specifies the maximum number of type i atoms in the cut-off radius

neuron

`[list[int]]` Number of neurons in each hidden layers of the embedding net \mathcal{N}

axis_neuron

Number of the axis neuron M_2 (number of columns of the sub-matrix of the embedding matrix)

resnet_dt

Time-step dt in the resnet construction: $y = x + dt * \phi(Wx + b)$

trainable

If the weights of embedding net are trainable.

seed

Random seed for initializing the network parameters.

type_one_side

Try to build N_{types} embedding nets. Otherwise, building N_{types}^2 embedding nets

exclude_types

`[List[List[int]]]` The excluded pairs of types which have no interaction with each other. For example, `[[0, 1]]` means no interaction between type 0 and type 1.

set_davg_zero

Set the shift of embedding net input to zero.

activation_function

The activation function in the embedding net. Supported options are “relu”, “relu6”, “softplus”, “sigmoid”, “tanh”, “gelu”, “gelu_tf”, “None”, “none”.

`precision`

The precision of the embedding net parameters. Supported options are “default”, “float16”, “float32”, “float64”, “bfloat16”.

`uniform_seed`

Only for the purpose of backward compatibility, retrieves the old behavior of using the random seed

`attn`

The length of hidden vector during scale-dot attention computation.

`attn_layer`

The number of layers in attention mechanism.

`attn_dotr`

Whether to dot the relative coordinates on the attention weights as a gated scheme.

`attn_mask`

Whether to mask the diagonal in the attention weights.

`multi_task`

If the model has multi fitting nets to train.

Attributes

`precision`

Precision of filter network.

Methods

<code>build(coord_, atype_, natoms, box_, mesh, ...)</code>	Build the computational graph for the descriptor.
<code>build_type_exclude_mask(exclude_types, ...)</code>	Build the type exclude mask for the attention descriptor.
<code>compute_input_stats(data_coord, data_box, ...)</code>	Compute the statistics (avg and std) of the training data.
<code>enable_compression(min_nbor_dist, graph, ...)</code>	Reveive the statistics (distance, max_nbor_size and env_mat_range) of the training data.
<code>enable_mixed_precision([mixed_prec])</code>	Reveive the mixed precision setting.
<code>get_dim_out()</code>	Returns the output dimension of this descriptor.
<code>get_dim_rot_mat_1()</code>	Returns the first dimension of the rotation matrix.
<code>get_feed_dict(coord_, atype_, natoms, box, mesh)</code>	Generate the feed_dict for current descriptor.
<code>get_nlist()</code>	Returns
<code>get_ntypes()</code>	Returns the number of atom types.
<code>get_rcut()</code>	Returns the cut-off radius.
<code>get_rot_mat()</code>	Get rotational matrix.
<code>get_tensor_names([suffix])</code>	Get names of tensors.
<code>init_variables(graph, graph_def[, suffix])</code>	Init the embedding net variables with the given dict.
<code>merge_input_stats(stat_dict)</code>	Merge the statistics computed from compute_input_stats to obtain the self.davg and self.dstd.
<code>pass_tensors_from_frz_model(descrpt_reshape ...)</code>	Pass the descrpt_reshape tensor as well as descrpt_deriv tensor from the frz graph_def.
<code>prod_force_virial(atom_ener, natoms)</code>	Compute force and virial.
<code>register(key)</code>	Register a descriptor plugin.

`build(coord_: Tensor, atype_: Tensor, natoms: Tensor, box_: Tensor, mesh: Tensor, input_dict: dict, reuse: bool | None = None, suffix: str = '') → Tensor`

Build the computational graph for the descriptor.

Parameters

`coord_`
The coordinate of atoms

`atype_`
The type of atoms

`natoms`
The number of atoms. This tensor has the length of Ntypes + 2 `natoms[0]`: number of local atoms `natoms[1]`: total number of atoms held by this processor `natoms[i]`: $2 \leq i < \text{Ntypes} + 2$, number of type i atoms

`box_`
[`tf.Tensor`] The box of the system

`mesh`
For historical reasons, only the length of the Tensor matters. if size of mesh == 6,

pbc is assumed. if size of mesh == 0, no-pbc is assumed.

input_dict

 Dictionary for additional inputs

reuse

 The weights in the networks should be reused when get the variable.

suffix

 Name suffix to identify this descriptor

Returns

descriptor

 The output descriptor

build_type_exclude_mask(exclude_types: List[Tuple[int, int]], ntypes: int, sel: List[int], ndescript: int, atype: Tensor, shape0: Tensor, nei_type_vec: Tensor) → Tensor

Build the type exclude mask for the attention descriptor.

Parameters

exclude_types

 [List[Tuple[int, int]]] The list of excluded types, e.g. [(0, 1), (1, 0)] means the interaction between type 0 and type 1 is excluded.

ntypes

 [int] The number of types.

sel

 [List[int]] The list of the number of selected neighbors for each type.

ndescript

 [int] The number of descriptors for each atom.

atype

 [tf.Tensor] The type of atoms, with the size of shape0.

shape0

 [tf.Tensor] The shape of the first dimension of the inputs, which is equal to nsamples * natoms.

nei_type_vec

 [tf.Tensor] The type of neighbors, with the size of (shape0, nnei).

Returns

 tf.Tensor

 The type exclude mask, with the shape of (shape0, ndescript), and the precision of GLOBAL_TF_FLOAT_PRECISION. The mask has the value of 1 if the interaction between two types is not excluded, and 0 otherwise.

See also:

deepmd.descriptor.descriptor.Descriptor.build_type_exclude_mask

Notes

This method has the similar way to build the type exclude mask as `deepmd.descriptor.descriptor.Descriptor.build_type_exclude_mask()`. The mathematical expression has been explained in that method. The difference is that the attention descriptor has provided the type of the neighbors (`idx_j`) that is not in order, so we use it from an extra input.

```
compute_input_stats(data_coord: list, data_box: list, data_atype: list, natoms_vec: list, mesh: list,
                    input_dict: dict, mixed_type: bool = False, real_natoms_vec: list | None =
                    None) → None
```

Compute the statistics (avg and std) of the training data. The input will be normalized by the statistics.

Parameters

`data_coord`

The coordinates. Can be generated by `deepmd.model.make_stat_input`

`data_box`

The box. Can be generated by `deepmd.model.make_stat_input`

`data_atype`

The atom types. Can be generated by `deepmd.model.make_stat_input`

`natoms_vec`

The vector for the number of atoms of the system and different types of atoms. If `mixed_type` is True, this para is blank. See `real_natoms_vec`.

`mesh`

The mesh for neighbor searching. Can be generated by `deepmd.model.make_stat_input`

`input_dict`

Dictionary for additional input

`mixed_type`

Whether to perform the mixed_type mode. If True, the input data has the mixed_type format (see `doc/model/train_se_atten.md`), in which frames in a system may have different `natoms_vec(s)`, with the same `nloc`.

`real_natoms_vec`

If `mixed_type` is True, it takes in the real `natoms_vec` for each frame.

```
init_variables(graph: Graph, graph_def: GraphDef, suffix: str = '') → None
```

Init the embedding net variables with the given dict.

Parameters

`graph`

[`tf.Graph`] The input frozen model graph

`graph_def`

[`tf.GraphDef`] The input frozen model graph_def

`suffix`

[`str`, optional] The suffix of the scope

```
class deepmd.descriptor.DescriptSeR(*args, **kwargs)
```

Bases: `DescriptSe`

DeepPot-SE constructed from radial information of atomic configurations.

The embedding takes the distance between atoms as input.

Parameters

- `rcut`
The cut-off radius
- `rcut_smth`
From where the environment matrix should be smoothed
- `sel`
`[list[str]]` `sel[i]` specifies the maximum number of type `i` atoms in the cut-off radius
- `neuron`
`[list[int]]` Number of neurons in each hidden layers of the embedding net
- `resnet_dt`
Time-step `dt` in the resnet construction: $y = x + dt * \phi(Wx + b)$
- `trainable`
If the weights of embedding net are trainable.
- `seed`
Random seed for initializing the network parameters.
- `type_one_side`
Try to build `N_types` embedding nets. Otherwise, building `N_types^2` embedding nets
- `exclude_types`
`[List[List[int]]]` The excluded pairs of types which have no interaction with each other. For example, `[[0, 1]]` means no interaction between type 0 and type 1.
- `activation_function`
The activation function in the embedding net. Supported options are “relu”, “relu6”, “softplus”, “sigmoid”, “tanh”, “gelu”, “gelu_tf”, “None”, “none”.
- `precision`
The precision of the embedding net parameters. Supported options are “default”, “float16”, “float32”, “float64”, “bfloat16”.
- `uniform_seed`
Only for the purpose of backward compatibility, retrieves the old behavior of using the random seed

Attributes

- `precision`
Precision of filter network.

Methods

<code>build(coord_, atype_, natoms, box_, mesh, ...)</code>	Build the computational graph for the descriptor.
<code>build_type_exclude_mask(exclude_types, ...)</code>	Build the type exclude mask for the descriptor.
<code>compute_input_stats(data_coord, data_box, ...)</code>	Compute the statistics (avg and std) of the training data.
<code>enable_compression(min_nbor_dist, graph, ...)</code>	Reveive the statistics (distance, max_nbor_size and env_mat_range) of the training data.
<code>enable_mixed_precision([mixed_prec])</code>	Reveive the mixed precision setting.
<code>get_dim_out()</code>	Returns the output dimension of this descriptor.
<code>get_dim_rot_mat_1()</code>	Returns the first dimension of the rotation matrix.
<code>get_feed_dict(coord_, atype_, natoms, box, mesh)</code>	Generate the feed_dict for current descriptor.
<code>get_nlist()</code>	Returns
<code>get_ntypes()</code>	Returns the number of atom types.
<code>get_rcut()</code>	Returns the cut-off radius.
<code>get_tensor_names([suffix])</code>	Get names of tensors.
<code>init_variables(graph, graph_def[, suffix])</code>	Init the embedding net variables with the given dict.
<code>merge_input_stats(stat_dict)</code>	Merge the statistics computed from compute_input_stats to obtain the self.davg and self.dstd.
<code>pass_tensors_from_frz_model(descrpt_reshape ...)</code>	Pass the descrpt_reshape tensor as well as descrpt_deriv tensor from the frz graph_def.
<code>prod_force_virial(atom_ener, natoms)</code>	Compute force and virial.
<code>register(key)</code>	Register a descriptor plugin.

build(coord_: Tensor, atype_: Tensor, natoms: Tensor, box_: Tensor, mesh: Tensor, input_dict: dict, reuse: bool | None = None, suffix: str = '') → Tensor

Build the computational graph for the descriptor.

Parameters

`coord_`
The coordinate of atoms

`atype_`
The type of atoms

`natoms`
The number of atoms. This tensor has the length of Ntypes + 2
natoms[0]: number of local atoms
natoms[1]: total number of atoms held by this processor
natoms[i]: 2 ≤ i < Ntypes+2, number of type i atoms

`box_`
[tf.Tensor] The box of the system

`mesh`
For historical reasons, only the length of the Tensor matters. if size of mesh == 6, pbc is assumed. if size of mesh == 0, no-pbc is assumed.

`input_dict`

Dictionary for additional inputs

`reuse`

The weights in the networks should be reused when get the variable.

`suffix`

Name suffix to identify this descriptor

Returns

descriptor

The output descriptor

compute_input_stats(data_coord, data_box, data_atype, natoms_vec, mesh, input_dict)

Compute the statisitcs (avg and std) of the training data. The input will be normalized by the statistics.

Parameters

`data_coord`

The coordinates. Can be generated by `deepmd.model.make_stat_input`

`data_box`

The box. Can be generated by `deepmd.model.make_stat_input`

`data_atype`

The atom types. Can be generated by `deepmd.model.make_stat_input`

`natoms_vec`

The vector for the number of atoms of the system and different types of atoms.
Can be generated by `deepmd.model.make_stat_input`

`mesh`

The mesh for neighbor searching. Can be generated by
`deepmd.model.make_stat_input`

`input_dict`

Dictionary for additional input

enable_compression(min_nbor_dist: float, graph: Graph, graph_def: GraphDef, table_extrapolate:
float = 5, table_stride_1: float = 0.01, table_stride_2: float = 0.1,
check_frequency: int = -1, suffix: str = '') → None

Reveive the statisitcs (distance, max_nbor_size and env_mat_range) of the training data.

Parameters

`min_nbor_dist`

The nearest distance between atoms

`graph`

[`tf.Graph`] The graph of the model

`graph_def`

[`tf.GraphDef`] The graph_def of the model

`table_extrapolate`

The scale of model extrapolation

`table_stride_1`

The uniform stride of the first table

`table_stride_2`
 The uniform stride of the second table

`check_frequency`
 The overflow check frequency

`suffix`
`[str, optional]` The suffix of the scope

`get_dim_out()`
 Returns the output dimension of this descriptor.

`get_nlist()`
 Returns

- `nlist`**
Neighbor list
- `rij`**
The relative distance between the neighbor and the center atom.
- `sel_a`**
The number of neighbors with full information
- `sel_r`**
The number of neighbors with only radial information

`get_ntypes()`
 Returns the number of atom types.

`get_rcut()`
 Returns the cut-off radius.

`merge_input_stats(stat_dict)`
 Merge the statisitcs computed from `compute_input_stats` to obtain the `self.davg` and `self.dstd`.

Parameters

- `stat_dict`
The dict of statisitcs computed from `compute_input_stats`, including:
 - `sumr`**
The sum of radial statisitcs.
 - `sumn`**
The sum of neighbor numbers.
 - `sumr2`**
The sum of square of radial statisitcs.

`prod_force_virial(atom_ener: Tensor, natoms: Tensor) → Tuple[Tensor, Tensor, Tensor]`
 Compute force and virial.

Parameters

- `atom_ener`
The atomic energy

natoms

The number of atoms. This tensor has the length of Ntypes + 2 natoms[0]: number of local atoms natoms[1]: total number of atoms held by this processor natoms[i]: $2 \leq i < \text{Ntypes} + 2$, number of type i atoms

Returns

force

The force on atoms

virial

The total virial

atom_virial

The atomic virial

class deepmd.descriptor.DescriptSeT(*args, **kwargs)

Bases: *DescriptSe*

DeepPot-SE constructed from all information (both angular and radial) of atomic configurations.

The embedding takes angles between two neighboring atoms as input.

Parameters

rcut

The cut-off radius

rcut_smth

From where the environment matrix should be smoothed

sel

[*list[str]*] sel[i] specifies the maximum number of type i atoms in the cut-off radius

neuron

[*list[int]*] Number of neurons in each hidden layers of the embedding net

resnet_dt

Time-step dt in the resnet construction: $y = x + dt * \phi(Wx + b)$

trainable

If the weights of embedding net are trainable.

seed

Random seed for initializing the network parameters.

set_davg_zero

Set the shift of embedding net input to zero.

activation_function

The activation function in the embedding net. Supported options are "relu", "relu6", "softplus", "sigmoid", "tanh", "gelu", "gelu_tf", "None", "none".

precision

The precision of the embedding net parameters. Supported options are "default", "float16", "float32", "float64", "bfloat16".

uniform_seed

Only for the purpose of backward compatibility, retrieves the old behavior of using the random seed

Attributes

precision

Precision of filter network.

Methods

<code>build(coord_, atype_, natoms, box_, mesh, ...)</code>	Build the computational graph for the descriptor.
<code>build_type_exclude_mask(exclude_types, ...)</code>	Build the type exclude mask for the descriptor.
<code>compute_input_stats(data_coord, data_box, ...)</code>	Compute the statisitcs (avg and std) of the training data.
<code>enable_compression(min_nbor_dist, graph, ...)</code>	Reveive the statisitcs (distance, max_nbor_size and env_mat_range) of the training data.
<code>enable_mixed_precision([mixed_prec])</code>	Reveive the mixed precision setting.
<code>get_dim_out()</code>	Returns the output dimension of this descriptor.
<code>get_dim_rot_mat_1()</code>	Returns the first dimension of the rotation matrix.
<code>get_feed_dict(coord_, atype_, natoms, box, mesh)</code>	Generate the feed_dict for current descriptor.
<code>get_nlist()</code>	Returns
<code>get_ntypes()</code>	Returns the number of atom types.
<code>get_rcut()</code>	Returns the cut-off radius.
<code>get_tensor_names([suffix])</code>	Get names of tensors.
<code>init_variables(graph, graph_def[, suffix])</code>	Init the embedding net variables with the given dict.
<code>merge_input_stats(stat_dict)</code>	Merge the statisitcs computed from compute_input_stats to obtain the self.davg and self.dstd.
<code>pass_tensors_from_frz_model(descrpt_reshape ...)</code>	Pass the descrpt_reshape tensor as well as descrpt_deriv tensor from the frz graph_def.
<code>prod_force_virial(atom_ener, natoms)</code>	Compute force and virial.
<code>register(key)</code>	Register a descriptor plugin.

build(coord_: Tensor, atype_: Tensor, natoms: Tensor, box_: Tensor, mesh: Tensor, input_dict: dict, reuse: bool | None = None, suffix: str = "") → Tensor

Build the computational graph for the descriptor.

Parameters

coord_

The coordinate of atoms

atype_

The type of atoms

natoms

The number of atoms. This tensor has the length of Ntypes + 2 natoms[0]: number of local atoms natoms[1]: total number of atoms held by this processor natoms[i]: 2 ≤ i < Ntypes+2, number of type i atoms

box_

[tf.Tensor] The box of the system

mesh

For historical reasons, only the length of the Tensor matters. if size of mesh == 6, pbc is assumed. if size of mesh == 0, no-pbc is assumed.

input_dict

Dictionary for additional inputs

reuse

The weights in the networks should be reused when get the variable.

suffix

Name suffix to identify this descriptor

Returns

descriptor

The output descriptor

compute_input_stats(data_coord: list, data_box: list, data_atype: list, natoms_vec: list, mesh: list, input_dict: dict) → None

Compute the statisitcs (avg and std) of the training data. The input will be normalized by the statistics.

Parameters

data_coord

The coordinates. Can be generated by deepmd.model.make_stat_input

data_box

The box. Can be generated by deepmd.model.make_stat_input

data_atype

The atom types. Can be generated by deepmd.model.make_stat_input

natoms_vec

The vector for the number of atoms of the system and different types of atoms.
Can be generated by deepmd.model.make_stat_input

mesh

The mesh for neighbor searching. Can be generated by
deepmd.model.make_stat_input

input_dict

Dictionary for additional input

enable_compression(min_nbor_dist: float, graph: Graph, graph_def: GraphDef, table_extrapolate: float = 5, table_stride_1: float = 0.01, table_stride_2: float = 0.1, check_frequency: int = -1, suffix: str = '') → None

Reveive the statisitcs (distance, max_nbor_size and env_mat_range) of the training data.

Parameters

min_nbor_dist

The nearest distance between atoms

graph

[tf.Graph] The graph of the model

graph_def

[tf.GraphDef] The graph_def of the model

table_extrapolate

The scale of model extrapolation

`table_stride_1`
 The uniform stride of the first table
`table_stride_2`
 The uniform stride of the second table
`check_frequency`
 The overflow check frequency
`suffix`
`[str, optional]` The suffix of the scope
`get_dim_out()` → `int`
 Returns the output dimension of this descriptor.
`get_nlist()` → `Tuple[Tensor, Tensor, List[int], List[int]]`
 Returns
 `nlist`
 Neighbor list
 `rij`
 The relative distance between the neighbor and the center atom.
 `sel_a`
 The number of neighbors with full information
 `sel_r`
 The number of neighbors with only radial information
`get_ntypes()` → `int`
 Returns the number of atom types.
`get_rcut()` → `float`
 Returns the cut-off radius.
`merge_input_stats(stat_dict)`
 Merge the statisitcs computed from `compute_input_stats` to obtain the `self.davg` and `self.dstd`.
 Parameters
 `stat_dict`
 The dict of statisitcs computed from `compute_input_stats`, including:
 `sumr`
 The sum of radial statisitcs.
 `suma`
 The sum of relative coord statisitcs.
 `sumn`
 The sum of neighbor numbers.
 `sumr2`
 The sum of square of radial statisitcs.
 `suma2`
 The sum of square of relative coord statisitcs.

`prod_force_virial(atom_ener: Tensor, natoms: Tensor) → Tuple[Tensor, Tensor, Tensor]`

Compute force and virial.

Parameters

`atom_ener`

The atomic energy

`natoms`

The number of atoms. This tensor has the length of `Ntypes + 2` `natoms[0]`: number of local atoms `natoms[1]`: total number of atoms held by this processor `natoms[i]`: $2 \leq i < Ntypes+2$, number of type `i` atoms

Returns

`force`

The force on atoms

`virial`

The total virial

`atom_virial`

The atomic virial

Submodules

`deepmd.descriptor.descriptor` module

`class deepmd.descriptor.descriptor.Descriptor(*args, **kwargs)`

Bases: *PluginVariant*

The abstract class for descriptors. All specific descriptors should be based on this class.

The descriptor \mathcal{D} describes the environment of an atom, which should be a function of coordinates and types of its neighbour atoms.

Notes

Only methods and attributes defined in this class are generally public, that can be called by other classes.

Examples

```
>>> descript = Descriptor(type="se_e2_a", rcut=6., rcut_smth=0.5, sel=[50])
>>> type(descript)
<class 'deepmd.descriptor.se_a.DescriptSeA'>
```

Methods

<code>build(coord_, atype_, natoms, box_, mesh, ...)</code>	Build the computational graph for the descriptor.
<code>build_type_exclude_mask(exclude_types, ...)</code>	Build the type exclude mask for the descriptor.
<code>compute_input_stats(data_coord, data_box, ...)</code>	Compute the statistics (avg and std) of the training data.
<code>enable_compression(min_nbor_dist, graph, ...)</code>	Reveive the statistics (distance, max_nbor_size and env_mat_range) of the training data.
<code>enable_mixed_precision([mixed_prec])</code>	Reveive the mixed precision setting.
<code>get_dim_out()</code>	Returns the output dimension of this descriptor.
<code>get_dim_rot_mat_1()</code>	Returns the first dimension of the rotation matrix.
<code>get_feed_dict(coord_, atype_, natoms, box, mesh)</code>	Generate the feed_dict for current descriptor.
<code>get_nlist()</code>	Returns neighbor information.
<code>get_ntypes()</code>	Returns the number of atom types.
<code>get_rcut()</code>	Returns the cut-off radius.
<code>get_tensor_names([suffix])</code>	Get names of tensors.
<code>init_variables(graph, graph_def[, suffix])</code>	Init the embedding net variables with the given dict.
<code>pass_tensors_from_frz_model(*tensors)</code>	Pass the descript_reshape tensor as well as descript_deriv tensor from the frz graph_def.
<code>prod_force_virial(atom_ener, natoms)</code>	Compute force and virial.
<code>register(key)</code>	Register a descriptor plugin.

abstract `build(coord_: Tensor, atype_: Tensor, natoms: Tensor, box_: Tensor, mesh: Tensor, input_dict: Dict[str, Any], reuse: bool | None = None, suffix: str = "")` → Tensor

Build the computational graph for the descriptor.

Parameters

`coord_`
[tf.Tensor] The coordinate of atoms

`atype_`
[tf.Tensor] The type of atoms

`natoms`
[tf.Tensor] The number of atoms. This tensor has the length of Ntypes + 2
natoms[0]: number of local atoms natoms[1]: total number of atoms held by this processor
natoms[i]: 2 ≤ i < Ntypes+2, number of type i atoms

`box_`
[tf.Tensor] The box of frames

`mesh`
[tf.Tensor] For historical reasons, only the length of the Tensor matters. if size of mesh == 6, pbc is assumed. if size of mesh == 0, no-pbc is assumed.

`input_dict`
[dict[str, Any]] Dictionary for additional inputs

`reuse`
[bool, optional] The weights in the networks should be reused when get the variable.

suffix
[`str`, `optional`] Name suffix to identify this descriptor

Returns

descriptor: `tf.Tensor`
The output descriptor

Notes

This method must be implemented, as it's called by other classes.

`build_type_exclude_mask(exclude_types: List[Tuple[int, int]], ntypes: int, sel: List[int], ndescript: int, atype: Tensor, shape0: Tensor) → Tensor`

Build the type exclude mask for the descriptor.

Parameters

exclude_types
[`List[Tuple[int, int]]`] The list of excluded types, e.g. [(0, 1), (1, 0)] means the interaction between type 0 and type 1 is excluded.

ntypes
[`int`] The number of types.

sel
[`List[int]`] The list of the number of selected neighbors for each type.

ndescript
[`int`] The number of descriptors for each atom.

atype
[`tf.Tensor`] The type of atoms, with the size of shape0.

shape0
[`tf.Tensor`] The shape of the first dimension of the inputs, which is equal to nsamples * natoms.

Returns

`tf.Tensor`
The type exclude mask, with the shape of (shape0, ndescript), and the precision of GLOBAL_TF_FLOAT_PRECISION. The mask has the value of 1 if the interaction between two types is not excluded, and 0 otherwise.

Notes

To exclude the interaction between two types, the derivative of energy with respect to distances (or angles) between two atoms should be zero[Rafclae60e195-1]_, i.e.

$$\forall i \in \text{type 1}, j \in \text{type 2}, \frac{\partial E}{\partial r_{ij}} = 0$$

When embedding networks between every two types are built, we can just remove that network. But when type_one_side is enabled, a network may be built for multiple pairs of types. In this case, we need to build a mask to exclude the interaction between two types.

The mask assumes the descriptors are sorted by neighbor type with the fixed number of given sel and each neighbor has the same number of descriptors (for example 4).

```
abstract compute_input_stats(data_coord: List[ndarray], data_box: List[ndarray], data_atype:
                             List[ndarray], natoms_vec: List[ndarray], mesh: List[ndarray],
                             input_dict: Dict[str, List[ndarray]]) → None
```

Compute the statistics (avg and std) of the training data. The input will be normalized by the statistics.

Parameters

data_coord
`[list[np.ndarray]]` The coordinates. Can be generated by `deepmd.model.model_stat.make_stat_input()`

data_box
`[list[np.ndarray]]` The box. Can be generated by `deepmd.model.model_stat.make_stat_input()`

data_atype
`[list[np.ndarray]]` The atom types. Can be generated by `deepmd.model.model_stat.make_stat_input()`

natoms_vec
`[list[np.ndarray]]` The vector for the number of atoms of the system and different types of atoms. Can be generated by `deepmd.model.model_stat.make_stat_input()`

mesh
`[list[np.ndarray]]` The mesh for neighbor searching. Can be generated by `deepmd.model.model_stat.make_stat_input()`

input_dict
`[dict[str, list[np.ndarray]]]` Dictionary for additional input

Notes

This method must be implemented, as it's called by other classes.

```
enable_compression(min_nbor_dist: float, graph: Graph, graph_def: GraphDef, table_extrapolate:
                    float = 5.0, table_stride_1: float = 0.01, table_stride_2: float = 0.1,
                    check_frequency: int = -1, suffix: str = '') → None
```

Reveive the statistics (distance, max_nbor_size and env_mat_range) of the training data.

Parameters

min_nbor_dist
`[float]` The nearest distance between atoms

graph
`[tf.Graph]` The graph of the model

graph_def
`[tf.GraphDef]` The graph definition of the model

table_extrapolate
`[float, default: 5.]` The scale of model extrapolation

table_stride_1
[`float`, default: 0.01] The uniform stride of the first table

table_stride_2
[`float`, default: 0.1] The uniform stride of the second table

check_frequency
[`int`, default: -1] The overflow check frequency

suffix
[`str`, optional] The suffix of the scope

Notes

This method is called by others when the descriptor supported compression.

enable_mixed_precision(mixed_prec: `dict` | `None` = `None`) → `None`

Reveive the mixed precision setting.

Parameters

mixed_prec
The mixed precision setting used in the embedding net

Notes

This method is called by others when the descriptor supported compression.

abstract get_dim_out() → `int`

Returns the output dimension of this descriptor.

Returns

`int`
the output dimension of this descriptor

Notes

This method must be implemented, as it's called by other classes.

get_dim_rot_mat_1() → `int`

Returns the first dimension of the rotation matrix. The rotation is of shape dim_1 x 3.

Returns

`int`
the first dimension of the rotation matrix

get_feed_dict(coord_: `Tensor`, atype_: `Tensor`, natoms: `Tensor`, box: `Tensor`, mesh: `Tensor`) →
`Dict`[`str`, `Tensor`]

Generate the feed_dict for current descriptor.

Parameters

coord_
[`tf.Tensor`] The coordinate of atoms

atype_
[`tf.Tensor`] The type of atoms

`natoms`
`[tf.Tensor]` The number of atoms. This tensor has the length of `Ntypes + 2`
`natoms[0]`: number of local atoms `natoms[1]`: total number of atoms held by this processor `natoms[i]`: $2 \leq i < Ntypes+2$, number of type `i` atoms

`box`
`[tf.Tensor]` The box. Can be generated by `deepmd.model.make_stat_input`

`mesh`
`[tf.Tensor]` For historical reasons, only the length of the Tensor matters. if size of `mesh == 6`, pbc is assumed. if size of `mesh == 0`, no-pbc is assumed.

Returns

`feed_dict`
`[dict[str, tf.Tensor]]` The output `feed_dict` of current descriptor

`get_nlist()` → `Tuple[Tensor, Tensor, List[int], List[int]]`

Returns neighbor information.

Returns

`nlist`
`[tf.Tensor]` Neighbor list

`rij`
`[tf.Tensor]` The relative distance between the neighbor and the center atom.

`sel_a`
`[list[int]]` The number of neighbors with full information

`sel_r`
`[list[int]]` The number of neighbors with only radial information

abstract `get_ntypes()` → `int`

Returns the number of atom types.

Returns

`int`
the number of atom types

Notes

This method must be implemented, as it's called by other classes.

abstract `get_rcut()` → `float`

Returns the cut-off radius.

Returns

`float`
the cut-off radius

Notes

This method must be implemented, as it's called by other classes.

get_tensor_names(suffix: str = '') → Tuple[str]

Get names of tensors.

Parameters

suffix
[str] The suffix of the scope

Returns

Tuple[str]
Names of tensors

init_variables(graph: Graph, graph_def: GraphDef, suffix: str = '') → None

Init the embedding net variables with the given dict.

Parameters

graph
[tf.Graph] The input frozen model graph
graph_def
[tf.GraphDef] The input frozen model graph_def
suffix
[str, optional] The suffix of the scope

Notes

This method is called by others when the descriptor supported initialization from the given variables.

pass_tensors_from_frz_model(*tensors: Tensor) → None

Pass the descrpt_reshape tensor as well as descrpt_deriv tensor from the frz graph_def.

Parameters

*tensors
[tf.Tensor] passed tensors

Notes

The number of parameters in the method must be equal to the numbers of returns in *get_tensor_names()*.

abstract prod_force_virial(atom_ener: Tensor, natoms: Tensor) → Tuple[Tensor, Tensor, Tensor]

Compute force and virial.

Parameters

atom_ener
[tf.Tensor] The atomic energy

`natoms`
 [`tf.Tensor`] The number of atoms. This tensor has the length of `Ntypes + 2`
`natoms[0]`: number of local atoms `natoms[1]`: total number of atoms held by this
 processor `natoms[i]`: $2 \leq i < Ntypes+2$, number of type `i` atoms

Returns

`force`
 [`tf.Tensor`] The force on atoms

`virial`
 [`tf.Tensor`] The total virial

`atom_virial`
 [`tf.Tensor`] The atomic virial

static register(key: `str`) → `Descriptor`

Register a descriptor plugin.

Parameters

`key`
 [`str`] the key of a descriptor

Returns

`Descriptor`
 the registered descriptor

Examples

```
>>> @Descriptor.register("some_descript")
class SomeDescript(Descriptor):
    pass
```

deepmd.descriptor.hybrid module

class `deepmd.descriptor.hybrid.DescriptHybrid(*args, **kwargs)`

Bases: `Descriptor`

Concatenate a list of descriptors to form a new descriptor.

Parameters

`list`
 [`list`] Build a descriptor from the concatenation of the list of descriptors.

Methods

<code>build(coord_, atype_, natoms, box_, mesh, ...)</code>	Build the computational graph for the descriptor.
<code>build_type_exclude_mask(exclude_types, ...)</code>	Build the type exclude mask for the descriptor.
<code>compute_input_stats(data_coord, data_box, ...)</code>	Compute the statistics (avg and std) of the training data.
<code>enable_compression(min_nbor_dist, graph, ...)</code>	Reveive the statistics (distance, max_nbor_size and env_mat_range) of the training data.
<code>enable_mixed_precision([mixed_prec])</code>	Reveive the mixed precision setting.
<code>get_dim_out()</code>	Returns the output dimension of this descriptor.
<code>get_dim_rot_mat_1()</code>	Returns the first dimension of the rotation matrix.
<code>get_feed_dict(coord_, atype_, natoms, box, mesh)</code>	Generate the feed_dict for current descriptor.
<code>get_nlist()</code>	Get the neighbor information of the descriptor, returns the nlist of the descriptor with the largest cut-off radius.
<code>get_nlist_i(ii)</code>	Get the neighbor information of the ii-th descriptor.
<code>get_ntypes()</code>	Returns the number of atom types.
<code>get_rcut()</code>	Returns the cut-off radius.
<code>get_tensor_names([suffix])</code>	Get names of tensors.
<code>init_variables(graph, graph_def[, suffix])</code>	Init the embedding net variables with the given dict.
<code>merge_input_stats(stat_dict)</code>	Merge the statistics computed from compute_input_stats to obtain the self.davg and self.dstd.
<code>pass_tensors_from_frz_model(*tensors)</code>	Pass the descript_reshape tensor as well as descript_deriv tensor from the frz graph_def.
<code>prod_force_virial(atom_ener, natoms)</code>	Compute force and virial.
<code>register(key)</code>	Register a descriptor plugin.

`build(coord_: Tensor, atype_: Tensor, natoms: Tensor, box_: Tensor, mesh: Tensor, input_dict: dict, reuse: bool | None = None, suffix: str = '') → Tensor`

Build the computational graph for the descriptor.

Parameters

`coord_`
The coordinate of atoms

`atype_`
The type of atoms

`natoms`
The number of atoms. This tensor has the length of Ntypes + 2 `natoms[0]`: number of local atoms `natoms[1]`: total number of atoms held by this processor `natoms[i]`: $2 \leq i < \text{Ntypes} + 2$, number of type i atoms

`box_`
[`tf.Tensor`] The box of the system

`mesh`
For historical reasons, only the length of the Tensor matters. if size of mesh == 6,

pbcs is assumed. if size of mesh == 0, no-pbc is assumed.

`input_dict`

Dictionary for additional inputs

`reuse`

The weights in the networks should be reused when get the variable.

`suffix`

Name suffix to identify this descriptor

Returns

descriptor

The output descriptor

compute_input_stats(data_coord: list, data_box: list, data_atype: list, natoms_vec: list, mesh: list, input_dict: dict) → None

Compute the statistics (avg and std) of the training data. The input will be normalized by the statistics.

Parameters

`data_coord`

The coordinates. Can be generated by `deepmd.model.make_stat_input`

`data_box`

The box. Can be generated by `deepmd.model.make_stat_input`

`data_atype`

The atom types. Can be generated by `deepmd.model.make_stat_input`

`natoms_vec`

The vector for the number of atoms of the system and different types of atoms.
Can be generated by `deepmd.model.make_stat_input`

`mesh`

The mesh for neighbor searching. Can be generated by `deepmd.model.make_stat_input`

`input_dict`

Dictionary for additional input

enable_compression(min_nbor_dist: float, graph: Graph, graph_def: GraphDef, table_extrapolate: float = 5.0, table_stride_1: float = 0.01, table_stride_2: float = 0.1, check_frequency: int = -1, suffix: str = '') → None

Reveive the statistics (distance, max_nbor_size and env_mat_range) of the training data.

Parameters

`min_nbor_dist`

[float] The nearest distance between atoms

`graph`

[tf.Graph] The graph of the model

`graph_def`

[tf.GraphDef] The graph_def of the model

`table_extrapolate`

[float, default: 5.] The scale of model extrapolation

`table_stride_1`
[`float`, default: 0.01] The uniform stride of the first table

`table_stride_2`
[`float`, default: 0.1] The uniform stride of the second table

`check_frequency`
[`int`, default: -1] The overflow check frequency

`suffix`
[`str`, optional] The suffix of the scope

`enable_mixed_precision`(mixed_prec: `dict` | `None` = `None`) → `None`
Reveive the mixed precision setting.

Parameters

`mixed_prec`
The mixed precision setting used in the embedding net

`get_dim_out()` → `int`
Returns the output dimension of this descriptor.

`get_nlist()` → `Tuple`[`Tensor`, `Tensor`, `List`[`int`], `List`[`int`]]
Get the neighbor information of the descriptor, returns the nlist of the descriptor with the largest cut-off radius.

Returns

`nlist`
Neighbor list

`rij`
The relative distance between the neighbor and the center atom.

`sel_a`
The number of neighbors with full information

`sel_r`
The number of neighbors with only radial information

`get_nlist_i`(ii: `int`) → `Tuple`[`Tensor`, `Tensor`, `List`[`int`], `List`[`int`]]
Get the neighbor information of the ii-th descriptor.

Parameters

`ii`
[`int`] The index of the descriptor

Returns

`nlist`
Neighbor list

`rij`
The relative distance between the neighbor and the center atom.

`sel_a`
The number of neighbors with full information

`sel_r`
The number of neighbors with only radial information

get_ntypes() → int

Returns the number of atom types.

get_rcut() → float

Returns the cut-off radius.

get_tensor_names(suffix: str = '') → Tuple[str]

Get names of tensors.

Parameters

suffix

[str] The suffix of the scope

Returns

Tuple[str]

Names of tensors

init_variables(graph: Graph, graph_def: GraphDef, suffix: str = '') → None

Init the embedding net variables with the given dict.

Parameters

graph

[tf.Graph] The input frozen model graph

graph_def

[tf.GraphDef] The input frozen model graph_def

suffix

[str, optional] The suffix of the scope

merge_input_stats(stat_dict)

Merge the statisitcs computed from compute_input_stats to obtain the self.davg and self.dstd.

Parameters

stat_dict

The dict of statisitcs computed from compute_input_stats, including:

sumr

The sum of radial statisitcs.

suma

The sum of relative coord statisitcs.

sumn

The sum of neighbor numbers.

sumr2

The sum of square of radial statisitcs.

suma2

The sum of square of relative coord statisitcs.

pass_tensors_from_frz_model(*tensors: Tensor) → None

Pass the descrtpt_reshape tensor as well as descrtpt_deriv tensor from the frz graph_def.

Parameters

*tensors
 [tf.Tensor] passed tensors

prod_force_virial(atom_ener: Tensor, natoms: Tensor) → Tuple[Tensor, Tensor, Tensor]
 Compute force and virial.

Parameters

atom_ener
 The atomic energy

natoms
 The number of atoms. This tensor has the length of Ntypes + 2 natoms[0]: number of local atoms natoms[1]: total number of atoms held by this processor natoms[i]: 2 ≤ i < Ntypes+2, number of type i atoms

Returns

force
 The force on atoms

virial
 The total virial

atom_virial
 The atomic virial

deepmd.descriptor.loc_frame module

class deepmd.descriptor.loc_frame.DescriptLocFrame(*args, **kwargs)

Bases: *Descriptor*

Defines a local frame at each atom, and the compute the descriptor as local coordinates under this frame.

Parameters

rcut

The cut-off radius

sel_a

[list[str]] The length of the list should be the same as the number of atom types in the system. sel_a[i] gives the selected number of type-i neighbors. The full relative coordinates of the neighbors are used by the descriptor.

sel_r

[list[str]] The length of the list should be the same as the number of atom types in the system. sel_r[i] gives the selected number of type-i neighbors. Only relative distance of the neighbors are used by the descriptor. sel_a[i] + sel_r[i] is recommended to be larger than the maximally possible number of type-i neighbors in the cut-off radius.

axis_rule: list[int]

The length should be 6 times of the number of types. - axis_rule[i*6+0]: class of the atom defining the first axis of type-i atom. 0 for neighbors with full coordinates and 1 for neighbors only with relative distance. - axis_rule[i*6+1]: type of the atom defining the first axis of type-i atom. - axis_rule[i*6+2]: index of the axis atom defining the first axis. Note that the neighbors with the same class and type are sorted according to their relative distance. - axis_rule[i*6+3]: class of the atom defining the

second axis of type-i atom. 0 for neighbors with full coordinates and 1 for neighbors only with relative distance. - axis_rule[i*6+4]: type of the atom defining the second axis of type-i atom. - axis_rule[i*6+5]: index of the axis atom defining the second axis. Note that the neighbors with the same class and type are sorted according to their relative distance.

Methods

<code>build(coord_, atype_, natoms, box_, mesh, ...)</code>	Build the computational graph for the descriptor.
<code>build_type_exclude_mask(exclude_types, ...)</code>	Build the type exclude mask for the descriptor.
<code>compute_input_stats(data_coord, data_box, ...)</code>	Compute the statistics (avg and std) of the training data.
<code>enable_compression(min_nbor_dist, graph, ...)</code>	Reveive the statistics (distance, max_nbor_size and env_mat_range) of the training data.
<code>enable_mixed_precision([mixed_prec])</code>	Reveive the mixed precision setting.
<code>get_dim_out()</code>	Returns the output dimension of this descriptor.
<code>get_dim_rot_mat_1()</code>	Returns the first dimension of the rotation matrix.
<code>get_feed_dict(coord_, atype_, natoms, box, mesh)</code>	Generate the feed_dict for current descriptor.
<code>get_nlist()</code>	Returns
<code>get_ntypes()</code>	Returns the number of atom types.
<code>get_rcut()</code>	Returns the cut-off radius.
<code>get_rot_mat()</code>	Get rotational matrix.
<code>get_tensor_names([suffix])</code>	Get names of tensors.
<code>init_variables(graph, graph_def[, suffix])</code>	Init the embedding net variables with the given dict.
<code>pass_tensors_from_frz_model(*tensors)</code>	Pass the descript_reshape tensor as well as descript_deriv tensor from the frz graph_def.
<code>prod_force_virial(atom_ener, natoms)</code>	Compute force and virial.
<code>register(key)</code>	Register a descriptor plugin.

`build(coord_: Tensor, atype_: Tensor, natoms: Tensor, box_: Tensor, mesh: Tensor, input_dict: dict, reuse: bool | None = None, suffix: str = '')` → Tensor

Build the computational graph for the descriptor.

Parameters

`coord_`
The coordinate of atoms

`atype_`
The type of atoms

`natoms`
The number of atoms. This tensor has the length of Ntypes + 2 `natoms[0]`: number of local atoms `natoms[1]`: total number of atoms held by this processor `natoms[i]`: $2 \leq i < \text{Ntypes} + 2$, number of type i atoms

`box_`
[tf.Tensor] The box of the system

mesh
For historical reasons, only the length of the Tensor matters. if size of mesh == 6, pbc is assumed. if size of mesh == 0, no-pbc is assumed.

input_dict
Dictionary for additional inputs

reuse
The weights in the networks should be reused when get the variable.

suffix
Name suffix to identify this descriptor

Returns

descriptor
The output descriptor

compute_input_stats(data_coord: list, data_box: list, data_atype: list, natoms_vec: list, mesh: list, input_dict: dict) → None

Compute the statisitcs (avg and std) of the training data. The input will be normalized by the statistics.

Parameters

data_coord
The coordinates. Can be generated by deepmd.model.make_stat_input

data_box
The box. Can be generated by deepmd.model.make_stat_input

data_atype
The atom types. Can be generated by deepmd.model.make_stat_input

natoms_vec
The vector for the number of atoms of the system and different types of atoms.
Can be generated by deepmd.model.make_stat_input

mesh
The mesh for neighbor searching. Can be generated by
deepmd.model.make_stat_input

input_dict
Dictionary for additional input

get_dim_out() → int
Returns the output dimension of this descriptor.

get_nlist() → Tuple[Tensor, Tensor, List[int], List[int]]

Returns

nlist
Neighbor list

rij
The relative distance between the neighbor and the center atom.

sel_a
The number of neighbors with full information

sel_r
The number of neighbors with only radial information

`get_ntypes()` → `int`

Returns the number of atom types.

`get_rcut()` → `float`

Returns the cut-off radius.

`get_rot_mat()` → `Tensor`

Get rotational matrix.

`init_variables(graph: Graph, graph_def: GraphDef, suffix: str = '')` → `None`

Init the embedding net variables with the given dict.

Parameters

`graph`

[`tf.Graph`] The input frozen model graph

`graph_def`

[`tf.GraphDef`] The input frozen model graph_def

`suffix`

[`str`, `optional`] The suffix of the scope

`prod_force_virial(atom_ener: Tensor, natoms: Tensor)` → `Tuple[Tensor, Tensor, Tensor]`

Compute force and virial.

Parameters

`atom_ener`

The atomic energy

`natoms`

The number of atoms. This tensor has the length of `Ntypes + 2` `natoms[0]`: number of local atoms `natoms[1]`: total number of atoms held by this processor `natoms[i]`: $2 \leq i < Ntypes + 2$, number of type `i` atoms

Returns

`force`

The force on atoms

`virial`

The total virial

`atom_virial`

The atomic virial

deepmd.descriptor.se module

`class deepmd.descriptor.se.DescriptSe(*args, **kwargs)`

Bases: *Descriptor*

A base class for smooth version of descriptors.

Notes

All of these descriptors have an environmental matrix and an embedding network (*deepmd.utils.network.embedding_net()*), so they can share some similiar methods without defining them twice.

Attributes

embedding_net_variables
[dict] initial embedding network variables

descript_reshape
[tf.Tensor] the reshaped descriptor

descript_deriv
[tf.Tensor] the descriptor derivative

rij
[tf.Tensor] distances between two atoms

nlist
[tf.Tensor] the neighbor list

Methods

build(coord_, atype_, natoms, box_, mesh, ...)	Build the computational graph for the descriptor.
build_type_exclude_mask(exclude_types, ...)	Build the type exclude mask for the descriptor.
compute_input_stats(data_coord, data_box, ...)	Compute the statisitcs (avg and std) of the training data.
enable_compression(min_nbor_dist, graph, ...)	Reveive the statisitcs (distance, max_nbor_size and env_mat_range) of the training data.
enable_mixed_precision([mixed_prec])	Reveive the mixed precision setting.
get_dim_out()	Returns the output dimension of this descriptor.
get_dim_rot_mat_1()	Returns the first dimension of the rotation matrix.
get_feed_dict(coord_, atype_, natoms, box, mesh)	Generate the feed_dict for current descriptor.
get_nlist()	Returns neighbor information.
get_ntypes()	Returns the number of atom types.
get_rcut()	Returns the cut-off radius.
get_tensor_names([suffix])	Get names of tensors.
init_variables(graph, graph_def[, suffix])	Init the embedding net variables with the given dict.
pass_tensors_from_frz_model(descript_reshape ...)	Pass the descript_reshape tensor as well as descript_deriv tensor from the frz graph_def.
prod_force_virial(atom_ener, natoms)	Compute force and virial.
register(key)	Register a descriptor plugin.

get_tensor_names(suffix: str = "") → Tuple[str]

Get names of tensors.

Parameters

suffix
[str] The suffix of the scope

Returns

`Tuple[str]`
Names of tensors

`init_variables`(graph: Graph, graph_def: GraphDef, suffix: str = "") → None

Init the embedding net variables with the given dict.

Parameters

graph
[`tf.Graph`] The input frozen model graph

graph_def
[`tf.GraphDef`] The input frozen model graph_def

suffix
[`str`, optional] The suffix of the scope

`pass_tensors_from_frz_model`(descript_reshape: Tensor, descript_deriv: Tensor, rij: Tensor, nlist: Tensor)

Pass the descript_reshape tensor as well as descript_deriv tensor from the frz graph_def.

Parameters

descript_reshape
The passed descript_reshape tensor

descript_deriv
The passed descript_deriv tensor

rij
The passed rij tensor

nlist
The passed nlist tensor

property precision: DType

Precision of filter network.

deepmd.descriptor.se_a module

`class deepmd.descriptor.se_a.DescriptSeA(*args, **kwargs)`

Bases: *DescriptSe*

DeepPot-SE constructed from all information (both angular and radial) of atomic configurations. The embedding takes the distance between atoms as input.

The descriptor $\mathcal{D}^i \in \mathbb{R}^{M_1 \times M_2}$ is given by [1]

$$\mathcal{D}^i = (\mathcal{G}^i)^T \mathcal{R}^i (\mathcal{R}^i)^T \mathcal{G}_{<}^i$$

where $\mathcal{R}^i \in \mathbb{R}^{N \times 4}$ is the coordinate matrix, and each row of \mathcal{R}^i can be constructed as follows

$$(\mathcal{R}^i)_j = \begin{bmatrix} \frac{s(r_{ji})}{s(r_{ji})x_{ji}} \\ \frac{r_{ji}^i}{s(r_{ji})y_{ji}} \\ \frac{r_{ji}^i}{s(r_{ji})z_{ji}} \\ \frac{r_{ji}^i}{r_{ji}} \end{bmatrix}$$

where $\mathbf{R}_{ji} = \mathbf{R}_j - \mathbf{R}_i = (x_{ji}, y_{ji}, z_{ji})$ is the relative coordinate and $r_{ji} = \|\mathbf{R}_{ji}\|$ is its norm. The switching function $s(r)$ is defined as:

$$s(r) = \begin{cases} \frac{1}{r}, & r < r_s \\ \frac{1}{r} \left\{ \left(\frac{r-r_s}{r_c-r_s} \right)^3 \left(-6 \left(\frac{r-r_s}{r_c-r_s} \right)^2 + 15 \frac{r-r_s}{r_c-r_s} - 10 \right) + 1 \right\}, & r_s \leq r < r_c \\ 0, & r \geq r_c \end{cases}$$

Each row of the embedding matrix $\mathcal{G}^i \in \mathbb{R}^{N \times M_1}$ consists of outputs of a embedding network \mathcal{N} of $s(r_{ji})$:

$$(\mathcal{G}^i)_j = \mathcal{N}(s(r_{ji}))$$

$\mathcal{G}^i_{<} \in \mathbb{R}^{N \times M_2}$ takes first M_2 columns of \mathcal{G}^i . The equation of embedding network \mathcal{N} can be found at [deepmd.utils.network.embedding_net\(\)](#).

Parameters

- rcut
The cut-off radius r_c
- rcut_smth
From where the environment matrix should be smoothed r_s
- sel
[[list](#)[[str](#)]] sel[i] specifies the maximum number of type i atoms in the cut-off radius
- neuron
[[list](#)[[int](#)]] Number of neurons in each hidden layers of the embedding net \mathcal{N}
- axis_neuron
Number of the axis neuron M_2 (number of columns of the sub-matrix of the embedding matrix)
- resnet_dt
Time-step dt in the resnet construction: $y = x + dt * \phi(Wx + b)$
- trainable
If the weights of embedding net are trainable.
- seed
Random seed for initializing the network parameters.
- type_one_side
Try to build N_types embedding nets. Otherwise, building N_types^2 embedding nets
- exclude_types
[[List](#)[[List](#)[[int](#)]]] The excluded pairs of types which have no interaction with each other. For example, [\[\[0, 1\]\]](#) means no interaction between type 0 and type 1.
- set_davg_zero
Set the shift of embedding net input to zero.
- activation_function
The activation function in the embedding net. Supported options are "relu", "relu6", "softplus", "sigmoid", "tanh", "gelu", "gelu_tf", "None", "none".
- precision
The precision of the embedding net parameters. Supported options are "default", "float16", "float32", "float64", "bfloat16".

`uniform_seed`

Only for the purpose of backward compatibility, retrieves the old behavior of using the random seed

`multi_task`

If the model has multi fitting nets to train.

References

[1]

Attributes

precision

Precision of filter network.

Methods

<code>build(coord_, atype_, natoms, box_, mesh, ...)</code>	Build the computational graph for the descriptor.
<code>build_type_exclude_mask(exclude_types, ...)</code>	Build the type exclude mask for the descriptor.
<code>compute_input_stats(data_coord, data_box, ...)</code>	Compute the statisitcs (avg and std) of the training data.
<code>enable_compression(min_nbor_dist, graph, ...)</code>	Reveive the statisitcs (distance, max_nbor_size and env_mat_range) of the training data.
<code>enable_mixed_precision([mixed_prec])</code>	Reveive the mixed precision setting.
<code>get_dim_out()</code>	Returns the output dimension of this descriptor.
<code>get_dim_rot_mat_1()</code>	Returns the first dimension of the rotation matrix.
<code>get_feed_dict(coord_, atype_, natoms, box, mesh)</code>	Generate the feed_dict for current descriptor.
<code>get_nlist()</code>	Returns
<code>get_ntypes()</code>	Returns the number of atom types.
<code>get_rcut()</code>	Returns the cut-off radius.
<code>get_rot_mat()</code>	Get rotational matrix.
<code>get_tensor_names([suffix])</code>	Get names of tensors.
<code>init_variables(graph, graph_def[, suffix])</code>	Init the embedding net variables with the given dict.
<code>merge_input_stats(stat_dict)</code>	Merge the statisitcs computed from compute_input_stats to obtain the self.davg and self.dstd.
<code>pass_tensors_from_frz_model(descrpt_reshape ...)</code>	Pass the descrpt_reshape tensor as well as descrpt_deriv tensor from the frz graph_def.
<code>prod_force_virial(atom_ener, natoms)</code>	Compute force and virial.
<code>register(key)</code>	Register a descriptor plugin.

`build(coord_: Tensor, atype_: Tensor, natoms: Tensor, box_: Tensor, mesh: Tensor, input_dict: dict, reuse: bool | None = None, suffix: str = '') → Tensor`

Build the computational graph for the descriptor.

Parameters

`coord_`
The coordinate of atoms

`atype_`
The type of atoms

`natoms`
The number of atoms. This tensor has the length of `Ntypes + 2` `natoms[0]`: number of local atoms `natoms[1]`: total number of atoms held by this processor `natoms[i]`: $2 \leq i < Ntypes+2$, number of type `i` atoms

`box_`
[`tf.Tensor`] The box of the system

`mesh`
For historical reasons, only the length of the Tensor matters. if size of mesh == 6, pbc is assumed. if size of mesh == 0, no-pbc is assumed.

`input_dict`
Dictionary for additional inputs

`reuse`
The weights in the networks should be reused when get the variable.

`suffix`
Name suffix to identify this descriptor

Returns

descriptor
The output descriptor

compute_input_stats(data_coord: list, data_box: list, data_atype: list, natoms_vec: list, mesh: list, input_dict: dict) → None

Compute the statistics (avg and std) of the training data. The input will be normalized by the statistics.

Parameters

`data_coord`
The coordinates. Can be generated by `deepmd.model.make_stat_input`

`data_box`
The box. Can be generated by `deepmd.model.make_stat_input`

`data_atype`
The atom types. Can be generated by `deepmd.model.make_stat_input`

`natoms_vec`
The vector for the number of atoms of the system and different types of atoms. Can be generated by `deepmd.model.make_stat_input`

`mesh`
The mesh for neighbor searching. Can be generated by `deepmd.model.make_stat_input`

`input_dict`
Dictionary for additional input

enable_compression(min_nbor_dist: float, graph: Graph, graph_def: GraphDef, table_extrapolate: float = 5, table_stride_1: float = 0.01, table_stride_2: float = 0.1, check_frequency: int = -1, suffix: str = '') → None

Reveive the statisitcs (distance, max_nbor_size and env_mat_range) of the training data.

Parameters

min_nbor_dist
The nearest distance between atoms

graph
[`tf.Graph`] The graph of the model

graph_def
[`tf.GraphDef`] The graph_def of the model

table_extrapolate
The scale of model extrapolation

table_stride_1
The uniform stride of the first table

table_stride_2
The uniform stride of the second table

check_frequency
The overflow check frequency

suffix
[`str`, `optional`] The suffix of the scope

enable_mixed_precision(mixed_prec: `dict` | `None` = `None`) → `None`

Reveive the mixed precision setting.

Parameters

mixed_prec
The mixed precision setting used in the embedding net

get_dim_out() → `int`

Returns the output dimension of this descriptor.

get_dim_rot_mat_1() → `int`

Returns the first dimension of the rotation matrix. The rotation is of shape dim_1 x 3.

get_nlist() → `Tuple`[`Tensor`, `Tensor`, `List`[`int`], `List`[`int`]]

Returns

nlist
Neighbor list

rij
The relative distance between the neighbor and the center atom.

sel_a
The number of neighbors with full information

sel_r
The number of neighbors with only radial information

get_ntypes() → `int`

Returns the number of atom types.

get_rcut() → float

Returns the cut-off radius.

get_rot_mat() → Tensor

Get rotational matrix.

init_variables(graph: Graph, graph_def: GraphDef, suffix: str = '') → None

Init the embedding net variables with the given dict.

Parameters

graph

[tf.Graph] The input frozen model graph

graph_def

[tf.GraphDef] The input frozen model graph_def

suffix

[str, optional] The suffix of the scope

merge_input_stats(stat_dict)

Merge the statistics computed from compute_input_stats to obtain the self.davg and self.dstd.

Parameters

stat_dict

The dict of statistics computed from compute_input_stats, including:

sumr

The sum of radial statistics.

suma

The sum of relative coord statistics.

sumn

The sum of neighbor numbers.

sumr2

The sum of square of radial statistics.

suma2

The sum of square of relative coord statistics.

prod_force_virial(atom_ener: Tensor, natoms: Tensor) → Tuple[Tensor, Tensor, Tensor]

Compute force and virial.

Parameters

atom_ener

The atomic energy

natoms

The number of atoms. This tensor has the length of Ntypes + 2 natoms[0]: number of local atoms natoms[1]: total number of atoms held by this processor natoms[i]: 2 ≤ i < Ntypes+2, number of type i atoms

Returns

force

The force on atoms

virial
The total virial

atom_virial
The atomic virial

deepmd.descriptor.se_a_ebd module

class deepmd.descriptor.se_a_ebd.DescriptSeAEbd(*args, **kwargs)

Bases: *DescriptSeA*

DeepPot-SE descriptor with type embedding approach.

Parameters

rcut
The cut-off radius

rcut_smth
From where the environment matrix should be smoothed

sel
[*list*[*str*]] sel[i] specifies the maxmum number of type i atoms in the cut-off radius

neuron
[*list*[*int*]] Number of neurons in each hidden layers of the embedding net

axis_neuron
Number of the axis neuron (number of columns of the sub-matrix of the embedding matrix)

resnet_dt
Time-step dt in the resnet construction: $y = x + dt * \phi(Wx + b)$

trainable
If the weights of embedding net are trainable.

seed
Random seed for initializing the network parameters.

type_one_side
Try to build N_{types} embedding nets. Otherwise, building N_{types}^2 embedding nets

type_nchanl
Number of channels for type representation

type_nlayer
Number of hidden layers for the type embedding net (skip connected).

numb_aparam
Number of atomic parameters. If >0 it will be embedded with atom types.

set_davg_zero
Set the shift of embedding net input to zero.

activation_function
The activation function in the embedding net. Supported options are {0}

precision
The precision of the embedding net parameters. Supported options are {1}

`exclude_types`
`[List[List[int]]]` The excluded pairs of types which have no interaction with each other. For example, `[[0, 1]]` means no interaction between type 0 and type 1.

Attributes

`precision`
Precision of filter network.

Methods

<code>build(coord_, atype_, natoms, box_, mesh, ...)</code>	Build the computational graph for the descriptor.
<code>build_type_exclude_mask(exclude_types, ...)</code>	Build the type exclude mask for the descriptor.
<code>compute_input_stats(data_coord, data_box, ...)</code>	Compute the statisitcs (avg and std) of the training data.
<code>enable_compression(min_nbor_dist, graph, ...)</code>	Reveive the statisitcs (distance, max_nbor_size and env_mat_range) of the training data.
<code>enable_mixed_precision([mixed_prec])</code>	Reveive the mixed precision setting.
<code>get_dim_out()</code>	Returns the output dimension of this descriptor.
<code>get_dim_rot_mat_1()</code>	Returns the first dimension of the rotation matrix.
<code>get_feed_dict(coord_, atype_, natoms, box, mesh)</code>	Generate the feed_dict for current descriptor.
<code>get_nlist()</code>	Returns
<code>get_ntypes()</code>	Returns the number of atom types.
<code>get_rcut()</code>	Returns the cut-off radius.
<code>get_rot_mat()</code>	Get rotational matrix.
<code>get_tensor_names([suffix])</code>	Get names of tensors.
<code>init_variables(graph, graph_def[, suffix])</code>	Init the embedding net variables with the given dict.
<code>merge_input_stats(stat_dict)</code>	Merge the statisitcs computed from <code>compute_input_stats</code> to obtain the <code>self.davg</code> and <code>self.dstd</code> .
<code>pass_tensors_from_frz_model(descrpt_reshape ...)</code>	Pass the <code>descrpt_reshape</code> tensor as well as <code>descrpt_deriv</code> tensor from the <code>frz graph_def</code> .
<code>prod_force_virial(atom_ener, natoms)</code>	Compute force and virial.
<code>register(key)</code>	Register a descriptor plugin.

`build(coord_: Tensor, atype_: Tensor, natoms: Tensor, box_: Tensor, mesh: Tensor, input_dict: dict, reuse: bool | None = None, suffix: str = '') → Tensor`

Build the computational graph for the descriptor.

Parameters

`coord_`
The coordinate of atoms

`atype_`
The type of atoms

`natoms`
The number of atoms. This tensor has the length of `Ntypes + 2` `natoms[0]`: number

of local atoms natoms[1]: total number of atoms held by this processor natoms[i]:
 $2 \leq i < Ntypes+2$, number of type i atoms

box_
 [tf.Tensor] The box of the system

mesh
 For historical reasons, only the length of the Tensor matters. if size of mesh == 6,
 pbc is assumed. if size of mesh == 0, no-pbc is assumed.

input_dict
 Dictionary for additional inputs

reuse
 The weights in the networks should be reused when get the variable.

suffix
 Name suffix to identify this descriptor

Returns

descriptor
 The output descriptor

deepmd.descriptor.se_a_ef module

class deepmd.descriptor.se_a_ef.DescriptSeAEf(*args, **kwargs)

Bases: *Descriptor*

Smooth edition descriptor with Ef.

Parameters

rcut
 The cut-off radius

rcut_smth
 From where the environment matrix should be smoothed

sel
 [list[str]] sel[i] specifies the maximum number of type i atoms in the cut-off radius

neuron
 [list[int]] Number of neurons in each hidden layers of the embedding net

axis_neuron
 Number of the axis neuron (number of columns of the sub-matrix of the embedding matrix)

resnet_dt
 Time-step dt in the resnet construction: $y = x + dt * \phi(Wx + b)$

trainable
 If the weights of embedding net are trainable.

seed
 Random seed for initializing the network parameters.

type_one_side
 Try to build N_types embedding nets. Otherwise, building N_types^2 embedding nets

`exclude_types`
 [List[List[int]]] The excluded pairs of types which have no interaction with each other. For example, `[[0, 1]]` means no interaction between type 0 and type 1.

`set_davg_zero`
 Set the shift of embedding net input to zero.

`activation_function`
 The activation function in the embedding net. Supported options are “relu”, “relu6”, “softplus”, “sigmoid”, “tanh”, “gelu”, “gelu_tf”, “None”, “none”.

`precision`
 The precision of the embedding net parameters. Supported options are “default”, “float16”, “float32”, “float64”, “bfloat16”.

`uniform_seed`
 Only for the purpose of backward compatibility, retrieves the old behavior of using the random seed

Methods

<code>build(coord_, atype_, natoms, box_, mesh, ...)</code>	Build the computational graph for the descriptor.
<code>build_type_exclude_mask(exclude_types, ...)</code>	Build the type exclude mask for the descriptor.
<code>compute_input_stats(data_coord, data_box, ...)</code>	Compute the statisitcs (avg and std) of the training data.
<code>enable_compression(min_nbor_dist, graph, ...)</code>	Reveive the statisitcs (distance, max_nbor_size and env_mat_range) of the training data.
<code>enable_mixed_precision([mixed_prec])</code>	Reveive the mixed precision setting.
<code>get_dim_out()</code>	Returns the output dimension of this descriptor.
<code>get_dim_rot_mat_1()</code>	Returns the first dimension of the rotation matrix.
<code>get_feed_dict(coord_, atype_, natoms, box, mesh)</code>	Generate the feed_dict for current descriptor.
<code>get_nlist()</code>	Returns
<code>get_ntypes()</code>	Returns the number of atom types.
<code>get_rcut()</code>	Returns the cut-off radius.
<code>get_rot_mat()</code>	Get rotational matrix.
<code>get_tensor_names([suffix])</code>	Get names of tensors.
<code>init_variables(graph, graph_def[, suffix])</code>	Init the embedding net variables with the given dict.
<code>pass_tensors_from_frz_model(*tensors)</code>	Pass the descript_reshape tensor as well as descript_deriv tensor from the frz graph_def.
<code>prod_force_virial(atom_ener, natoms)</code>	Compute force and virial.
<code>register(key)</code>	Register a descriptor plugin.

`build(coord_: Tensor, atype_: Tensor, natoms: Tensor, box_: Tensor, mesh: Tensor, input_dict: dict, reuse: bool | None = None, suffix: str = '')` → Tensor

Build the computational graph for the descriptor.

Parameters

`coord_`
The coordinate of atoms

`atype_`
The type of atoms

`natoms`
The number of atoms. This tensor has the length of `Ntypes + 2` `natoms[0]`: number of local atoms `natoms[1]`: total number of atoms held by this processor `natoms[i]`: $2 \leq i < Ntypes+2$, number of type `i` atoms

`box_`
[`tf.Tensor`] The box of the system

`mesh`
For historical reasons, only the length of the Tensor matters. if size of `mesh == 6`, pbc is assumed. if size of `mesh == 0`, no-pbc is assumed.

`input_dict`
Dictionary for additional inputs. Should have 'efield'.

`reuse`
The weights in the networks should be reused when get the variable.

`suffix`
Name suffix to identify this descriptor

Returns

descriptor
The output descriptor

compute_input_stats(`data_coord`: list, `data_box`: list, `data_atype`: list, `natoms_vec`: list, `mesh`: list, `input_dict`: dict) → None

Compute the statistics (avg and std) of the training data. The input will be normalized by the statistics.

Parameters

`data_coord`
The coordinates. Can be generated by `deepmd.model.make_stat_input`

`data_box`
The box. Can be generated by `deepmd.model.make_stat_input`

`data_atype`
The atom types. Can be generated by `deepmd.model.make_stat_input`

`natoms_vec`
The vector for the number of atoms of the system and different types of atoms. Can be generated by `deepmd.model.make_stat_input`

`mesh`
The mesh for neighbor searching. Can be generated by `deepmd.model.make_stat_input`

`input_dict`
Dictionary for additional input

get_dim_out() → int

Returns the output dimension of this descriptor.

`get_dim_rot_mat_1()` → `int`

Returns the first dimension of the rotation matrix. The rotation is of shape `dim_1` x 3.

`get_nlist()` → `Tuple[Tensor, Tensor, List[int], List[int]]`

Returns

nlist

Neighbor list

rij

The relative distance between the neighbor and the center atom.

sel_a

The number of neighbors with full information

sel_r

The number of neighbors with only radial information

`get_ntypes()` → `int`

Returns the number of atom types.

`get_rcut()` → `float`

Returns the cut-off radius.

`get_rot_mat()` → `Tensor`

Get rotational matrix.

`prod_force_virial(atom_ener: Tensor, natoms: Tensor)` → `Tuple[Tensor, Tensor, Tensor]`

Compute force and virial.

Parameters

atom_ener

The atomic energy

natoms

The number of atoms. This tensor has the length of `Ntypes + 2` `natoms[0]`: number of local atoms `natoms[1]`: total number of atoms held by this processor `natoms[i]`: $2 \leq i < Ntypes+2$, number of type `i` atoms

Returns

force

The force on atoms

virial

The total virial

atom_virial

The atomic virial

`class deepmd.descriptor.se_a_ef.DescriptSeAEfLower(*args, **kwargs)`

Bases: *DescriptSeA*

Helper class for implementing *DescriptSeAEf*.

Attributes

precision

Precision of filter network.

Methods

<code>build(coord_, atype_, natoms, box_, mesh, ...)</code>	Build the computational graph for the descriptor.
<code>build_type_exclude_mask(exclude_types, ...)</code>	Build the type exclude mask for the descriptor.
<code>compute_input_stats(data_coord, data_box, ...)</code>	Compute the statistics (avg and std) of the training data.
<code>enable_compression(min_nbor_dist, graph, ...)</code>	Reveive the statistics (distance, max_nbor_size and env_mat_range) of the training data.
<code>enable_mixed_precision([mixed_prec])</code>	Reveive the mixed precision setting.
<code>get_dim_out()</code>	Returns the output dimension of this descriptor.
<code>get_dim_rot_mat_1()</code>	Returns the first dimension of the rotation matrix.
<code>get_feed_dict(coord_, atype_, natoms, box, mesh)</code>	Generate the feed_dict for current descriptor.
<code>get_nlist()</code>	Returns
<code>get_ntypes()</code>	Returns the number of atom types.
<code>get_rcut()</code>	Returns the cut-off radius.
<code>get_rot_mat()</code>	Get rotational matrix.
<code>get_tensor_names([suffix])</code>	Get names of tensors.
<code>init_variables(graph, graph_def[, suffix])</code>	Init the embedding net variables with the given dict.
<code>merge_input_stats(stat_dict)</code>	Merge the statistics computed from compute_input_stats to obtain the self.davg and self.dstd.
<code>pass_tensors_from_frz_model(descrpt_reshape ...)</code>	Pass the descrpt_reshape tensor as well as descrpt_deriv tensor from the frz graph_def.
<code>prod_force_virial(atom_ener, natoms)</code>	Compute force and virial.
<code>register(key)</code>	Register a descriptor plugin.

`build(coord_, atype_, natoms, box_, mesh, input_dict, suffix='', reuse=None)`

Build the computational graph for the descriptor.

Parameters

`coord_`
The coordinate of atoms

`atype_`
The type of atoms

`natoms`
The number of atoms. This tensor has the length of Ntypes + 2
natoms[0]: number of local atoms
natoms[1]: total number of atoms held by this processor
natoms[i]: 2 ≤ i < Ntypes+2, number of type i atoms

`box_`
[`tf.Tensor`] The box of the system

`mesh`
For historical reasons, only the length of the Tensor matters. if size of mesh == 6, pbc is assumed. if size of mesh == 0, no-pbc is assumed.

`input_dict`
Dictionary for additional inputs

`reuse`
The weights in the networks should be reused when get the variable.

`suffix`
Name suffix to identify this descriptor

Returns

descriptor
The output descriptor

compute_input_stats(data_coord, data_box, data_atype, natoms_vec, mesh, input_dict)
Compute the statisitcs (avg and std) of the training data. The input will be normalized by the statistics.

Parameters

`data_coord`
The coordinates. Can be generated by `deepmd.model.make_stat_input`

`data_box`
The box. Can be generated by `deepmd.model.make_stat_input`

`data_atype`
The atom types. Can be generated by `deepmd.model.make_stat_input`

`natoms_vec`
The vector for the number of atoms of the system and different types of atoms.
Can be generated by `deepmd.model.make_stat_input`

`mesh`
The mesh for neighbor searching. Can be generated by `deepmd.model.make_stat_input`

`input_dict`
Dictionary for additional input

deepmd.descriptor.se_a_mask module

class `deepmd.descriptor.se_a_mask.DescriptSeAMask`(*args, **kwargs)

Bases: *DescriptSeA*

DeepPot-SE constructed from all information (both angular and radial) of atomic configurations. The embedding takes the distance between atoms as input.

The descriptor $\mathcal{D}^i \in \mathcal{R}^{M_1 \times M_2}$ is given by [1]

$$\mathcal{D}^i = (\mathcal{G}^i)^T \mathcal{R}^i (\mathcal{R}^i)^T \mathcal{G}_{<}^i$$

where $\mathcal{R}^i \in \mathbb{R}^{N \times 4}$ is the coordinate matrix, and each row of \mathcal{R}^i can be constructed as follows

$$(\mathcal{R}^i)_j = \begin{bmatrix} \frac{s(r_{ji})}{s(r_{ji})x_{ji}} \\ \frac{r_{ji}}{s(r_{ji})y_{ji}} \\ \frac{r_{ji}}{s(r_{ji})z_{ji}} \end{bmatrix}$$

where $\mathbf{R}_{ji} = \mathbf{R}_j - \mathbf{R}_i = (x_{ji}, y_{ji}, z_{ji})$ is the relative coordinate and $r_{ji} = \|\mathbf{R}_{ji}\|$ is its norm. The switching function $s(r)$ is defined as:

$$s(r) = \begin{cases} \frac{1}{r}, & r < r_s \\ \frac{1}{r} \left\{ \left(\frac{r-r_s}{r_c-r_s} \right)^3 \left(-6 \left(\frac{r-r_s}{r_c-r_s} \right)^2 + 15 \frac{r-r_s}{r_c-r_s} - 10 \right) + 1 \right\}, & r_s \leq r < r_c \\ 0, & r \geq r_c \end{cases}$$

Each row of the embedding matrix $\mathcal{G}^i \in \mathbb{R}^{N \times M_1}$ consists of outputs of a embedding network \mathcal{N} of $s(r_{ji})$:

$$(\mathcal{G}^i)_j = \mathcal{N}(s(r_{ji}))$$

$\mathcal{G}^i_{<} \in \mathbb{R}^{N \times M_2}$ takes first M_2 columns of \mathcal{G}^i . The equation of embedding network \mathcal{N} can be found at `deepmd.utils.network.embedding_net()`. Specially for descriptor `se_a_mask` is a concise implementation of `se_a`. The difference is that `se_a_mask` only considered a non-pbc system. And accept a mask matrix to indicate the atom i in frame j is a real atom or not. (1 means real atom, 0 means ghost atom) Thus `se_a_mask` can accept a variable number of atoms in a frame.

Parameters

- `sel`
[`list[str]`] `sel[i]` specifies the maximum number of type i atoms in the neighbor list.
- `neuron`
[`list[int]`] Number of neurons in each hidden layers of the embedding net \mathcal{N}
- `axis_neuron`
Number of the axis neuron M_2 (number of columns of the sub-matrix of the embedding matrix)
- `resnet_dt`
Time-step dt in the resnet construction: $y = x + dt * \phi(Wx + b)$
- `trainable`
If the weights of embedding net are trainable.
- `seed`
Random seed for initializing the network parameters.
- `type_one_side`
Try to build N_{types} embedding nets. Otherwise, building N_{types}^2 embedding nets
- `exclude_types`
[`List[List[int]]`] The excluded pairs of types which have no interaction with each other. For example, `[[0, 1]]` means no interaction between type 0 and type 1.
- `activation_function`
The activation function in the embedding net. Supported options are {0}
- `precision`
The precision of the embedding net parameters. Supported options are {1}
- `uniform_seed`
Only for the purpose of backward compatibility, retrieves the old behavior of using the random seed

Attributes

precision

Precision of filter network.

Methods

<code>build(coord_, atype_, natoms, box_, mesh, ...)</code>	Build the computational graph for the descriptor.
<code>build_type_exclude_mask(exclude_types, ...)</code>	Build the type exclude mask for the descriptor.
<code>compute_input_stats(data_coord, data_box, ...)</code>	Compute the statisitcs (avg and std) of the training data.
<code>enable_compression(min_nbor_dist, graph, ...)</code>	Reveive the statisitcs (distance, max_nbor_size and env_mat_range) of the training data.
<code>enable_mixed_precision([mixed_prec])</code>	Reveive the mixed precision setting.
<code>get_dim_out()</code>	Returns the output dimension of this descriptor.
<code>get_dim_rot_mat_1()</code>	Returns the first dimension of the rotation matrix.
<code>get_feed_dict(coord_, atype_, natoms, box, mesh)</code>	Generate the feed_dict for current descriptor.
<code>get_nlist()</code>	Returns
<code>get_ntypes()</code>	Returns the number of atom types.
<code>get_rcut()</code>	Returns the cutoff radius.
<code>get_rot_mat()</code>	Get rotational matrix.
<code>get_tensor_names([suffix])</code>	Get names of tensors.
<code>init_variables(graph, graph_def[, suffix])</code>	Init the embedding net variables with the given dict.
<code>merge_input_stats(stat_dict)</code>	Merge the statisitcs computed from compute_input_stats to obtain the self.davg and self.dstd.
<code>pass_tensors_from_frz_model(descrpt_reshape ...)</code>	Pass the descrpt_reshape tensor as well as descrpt_deriv tensor from the frz graph_def.
<code>prod_force_virial(atom_ener, natoms)</code>	Compute force and virial.
<code>register(key)</code>	Register a descriptor plugin.

build(coord_: Tensor, atype_: Tensor, natoms: Tensor, box_: Tensor, mesh: Tensor, input_dict: Dict[str, Any], reuse: bool | None = None, suffix: str = '') → Tensor

Build the computational graph for the descriptor.

Parameters

coord_

The coordinate of atoms

atype_

The type of atoms

natoms

The number of atoms. This tensor has the length of Ntypes + 2 natoms[0]: number

of local atoms `natoms[1]`: total number of atoms held by this processor `natoms[i]`:
 $2 \leq i < \text{Ntypes} + 2$, number of type i atoms

`box_`
`[tf.Tensor]` The box of the system

`mesh`
 For historical reasons, only the length of the Tensor matters. if size of `mesh == 6`,
 pbc is assumed. if size of `mesh == 0`, no-pbc is assumed.

`input_dict`
 Dictionary for additional inputs

`reuse`
 The weights in the networks should be reused when get the variable.

`suffix`
 Name suffix to identify this descriptor

Returns

descriptor
 The output descriptor

compute_input_stats(`data_coord`: list, `data_box`: list, `data_atype`: list, `natoms_vec`: list, `mesh`: list,
`input_dict`: dict) \rightarrow None

Compute the statisitcs (avg and std) of the training data. The input will be normalized by the
 statistics.

Parameters

`data_coord`
 The coordinates. Can be generated by `deepmd.model.make_stat_input`

`data_box`
 The box. Can be generated by `deepmd.model.make_stat_input`

`data_atype`
 The atom types. Can be generated by `deepmd.model.make_stat_input`

`natoms_vec`
 The vector for the number of atoms of the system and different types of atoms.
 Can be generated by `deepmd.model.make_stat_input`

`mesh`
 The mesh for neighbor searching. Can be generated by
`deepmd.model.make_stat_input`

`input_dict`
 Dictionary for additional input

get_rcut() \rightarrow float
 Returns the cutoff radius.

prod_force_virial(`atom_ener`: Tensor, `natoms`: Tensor) \rightarrow Tuple[Tensor, Tensor, Tensor]
 Compute force and virial.

Parameters

`atom_ener`
 The atomic energy

natoms
 The number of atoms. This tensor has the length of $N_{\text{types}} + 2$ `natoms[0]`: number of local atoms `natoms[1]`: total number of atoms held by this processor `natoms[i]`: $2 \leq i < N_{\text{types}} + 2$, number of type i atoms

Returns

force
 The force on atoms

virial
 None for `se_a_mask` op

atom_virial
 None for `se_a_mask` op

deepmd.descriptor.se_atten module

class `deepmd.descriptor.se_atten.DescriptSeAtten(*args, **kwargs)`

Bases: *DescriptSeA*

Smooth version descriptor with attention.

Parameters

rcut
 The cut-off radius r_c

rcut_smth
 From where the environment matrix should be smoothed r_s

sel
`[list[str]]` `sel[i]` specifies the maximum number of type i atoms in the cut-off radius

neuron
`[list[int]]` Number of neurons in each hidden layers of the embedding net \mathcal{N}

axis_neuron
 Number of the axis neuron M_2 (number of columns of the sub-matrix of the embedding matrix)

resnet_dt
 Time-step dt in the resnet construction: $y = x + dt * \phi(Wx + b)$

trainable
 If the weights of embedding net are trainable.

seed
 Random seed for initializing the network parameters.

type_one_side
 Try to build N_{types} embedding nets. Otherwise, building N_{types}^2 embedding nets

exclude_types
`[List[List[int]]]` The excluded pairs of types which have no interaction with each other. For example, `[[0, 1]]` means no interaction between type 0 and type 1.

set_davg_zero
 Set the shift of embedding net input to zero.

activation_function

The activation function in the embedding net. Supported options are “relu”, “relu6”, “softplus”, “sigmoid”, “tanh”, “gelu”, “gelu_tf”, “None”, “none”.

precision

The precision of the embedding net parameters. Supported options are “default”, “float16”, “float32”, “float64”, “bfloat16”.

uniform_seed

Only for the purpose of backward compatibility, retrieves the old behavior of using the random seed

attn

The length of hidden vector during scale-dot attention computation.

attn_layer

The number of layers in attention mechanism.

attn_dotr

Whether to dot the relative coordinates on the attention weights as a gated scheme.

attn_mask

Whether to mask the diagonal in the attention weights.

multi_task

If the model has multi fitting nets to train.

Attributes**precision**

Precision of filter network.

Methods

<code>build(coord_, atype_, natoms, box_, mesh, ...)</code>	Build the computational graph for the descriptor.
<code>build_type_exclude_mask(exclude_types, ...)</code>	Build the type exclude mask for the attention descriptor.
<code>compute_input_stats(data_coord, data_box, ...)</code>	Compute the statistics (avg and std) of the training data.
<code>enable_compression(min_nbor_dist, graph, ...)</code>	Reveive the statistics (distance, max_nbor_size and env_mat_range) of the training data.
<code>enable_mixed_precision([mixed_prec])</code>	Reveive the mixed precision setting.
<code>get_dim_out()</code>	Returns the output dimension of this descriptor.
<code>get_dim_rot_mat_1()</code>	Returns the first dimension of the rotation matrix.
<code>get_feed_dict(coord_, atype_, natoms, box, mesh)</code>	Generate the feed_dict for current descriptor.
<code>get_nlist()</code>	Returns
<code>get_ntypes()</code>	Returns the number of atom types.
<code>get_rcut()</code>	Returns the cut-off radius.
<code>get_rot_mat()</code>	Get rotational matrix.
<code>get_tensor_names([suffix])</code>	Get names of tensors.
<code>init_variables(graph, graph_def[, suffix])</code>	Init the embedding net variables with the given dict.
<code>merge_input_stats(stat_dict)</code>	Merge the statistics computed from compute_input_stats to obtain the self.davg and self.dstd.
<code>pass_tensors_from_frz_model(descrpt_reshape ...)</code>	Pass the descrpt_reshape tensor as well as descrpt_deriv tensor from the frz graph_def.
<code>prod_force_virial(atom_ener, natoms)</code>	Compute force and virial.
<code>register(key)</code>	Register a descriptor plugin.

`build(coord_: Tensor, atype_: Tensor, natoms: Tensor, box_: Tensor, mesh: Tensor, input_dict: dict, reuse: bool | None = None, suffix: str = '') → Tensor`

Build the computational graph for the descriptor.

Parameters

`coord_`
The coordinate of atoms

`atype_`
The type of atoms

`natoms`
The number of atoms. This tensor has the length of Ntypes + 2 `natoms[0]`: number of local atoms `natoms[1]`: total number of atoms held by this processor `natoms[i]`: $2 \leq i < \text{Ntypes} + 2$, number of type i atoms

`box_`
[`tf.Tensor`] The box of the system

`mesh`
For historical reasons, only the length of the Tensor matters. if size of mesh == 6,

pbcs is assumed. if size of mesh == 0, no-pbc is assumed.

`input_dict`

Dictionary for additional inputs

`reuse`

The weights in the networks should be reused when get the variable.

`suffix`

Name suffix to identify this descriptor

Returns

`descriptor`

The output descriptor

`build_type_exclude_mask`(`exclude_types`: `List[Tuple[int, int]]`, `ntypes`: `int`, `sel`: `List[int]`, `ndescript`: `int`, `atype`: `Tensor`, `shape0`: `Tensor`, `nei_type_vec`: `Tensor`) → `Tensor`

Build the type exclude mask for the attention descriptor.

Parameters

`exclude_types`

[`List[Tuple[int, int]]`] The list of excluded types, e.g. [(0, 1), (1, 0)] means the interaction between type 0 and type 1 is excluded.

`ntypes`

[`int`] The number of types.

`sel`

[`List[int]`] The list of the number of selected neighbors for each type.

`ndescript`

[`int`] The number of descriptors for each atom.

`atype`

[`tf.Tensor`] The type of atoms, with the size of `shape0`.

`shape0`

[`tf.Tensor`] The shape of the first dimension of the inputs, which is equal to `nsamples * natoms`.

`nei_type_vec`

[`tf.Tensor`] The type of neighbors, with the size of (`shape0`, `nnnei`).

Returns

`tf.Tensor`

The type exclude mask, with the shape of (`shape0`, `ndescript`), and the precision of `GLOBAL_TF_FLOAT_PRECISION`. The mask has the value of 1 if the interaction between two types is not excluded, and 0 otherwise.

See also:

`deepmd.descriptor.descriptor.Descriptor.build_type_exclude_mask`

Notes

This method has the similar way to build the type exclude mask as `deepmd.descriptor.descriptor.Descriptor.build_type_exclude_mask()`. The mathematical expression has been explained in that method. The difference is that the attention descriptor has provided the type of the neighbors (`idx_j`) that is not in order, so we use it from an extra input.

```
compute_input_stats(data_coord: list, data_box: list, data_atype: list, natoms_vec: list, mesh: list,
                    input_dict: dict, mixed_type: bool = False, real_natoms_vec: list | None =
                    None) → None
```

Compute the statistics (avg and std) of the training data. The input will be normalized by the statistics.

Parameters

`data_coord`

The coordinates. Can be generated by `deepmd.model.make_stat_input`

`data_box`

The box. Can be generated by `deepmd.model.make_stat_input`

`data_atype`

The atom types. Can be generated by `deepmd.model.make_stat_input`

`natoms_vec`

The vector for the number of atoms of the system and different types of atoms. If `mixed_type` is True, this para is blank. See `real_natoms_vec`.

`mesh`

The mesh for neighbor searching. Can be generated by `deepmd.model.make_stat_input`

`input_dict`

Dictionary for additional input

`mixed_type`

Whether to perform the `mixed_type` mode. If True, the input data has the `mixed_type` format (see `doc/model/train_se_atten.md`), in which frames in a system may have different `natoms_vec(s)`, with the same `nloc`.

`real_natoms_vec`

If `mixed_type` is True, it takes in the real `natoms_vec` for each frame.

```
init_variables(graph: Graph, graph_def: GraphDef, suffix: str = '') → None
```

Init the embedding net variables with the given dict.

Parameters

`graph`

[`tf.Graph`] The input frozen model graph

`graph_def`

[`tf.GraphDef`] The input frozen model `graph_def`

`suffix`

[`str`, optional] The suffix of the scope

deepmd.descriptor.se_r module

```
class deepmd.descriptor.se_r.DescriptSeR(*args, **kwargs)
```

Bases: *DescriptSe*

DeepPot-SE constructed from radial information of atomic configurations.

The embedding takes the distance between atoms as input.

Parameters

`rcut`

The cut-off radius

`rcut_smth`

From where the environment matrix should be smoothed

`sel`

`[list[str]]` `sel[i]` specifies the maximum number of type `i` atoms in the cut-off radius

`neuron`

`[list[int]]` Number of neurons in each hidden layers of the embedding net

`resnet_dt`

Time-step `dt` in the resnet construction: $y = x + dt * \phi(Wx + b)$

`trainable`

If the weights of embedding net are trainable.

`seed`

Random seed for initializing the network parameters.

`type_one_side`

Try to build `N_types` embedding nets. Otherwise, building `N_types^2` embedding nets

`exclude_types`

`[List[List[int]]]` The excluded pairs of types which have no interaction with each other. For example, `[[0, 1]]` means no interaction between type 0 and type 1.

`activation_function`

The activation function in the embedding net. Supported options are “relu”, “relu6”, “softplus”, “sigmoid”, “tanh”, “gelu”, “gelu_tf”, “None”, “none”.

`precision`

The precision of the embedding net parameters. Supported options are “default”, “float16”, “float32”, “float64”, “bfloat16”.

`uniform_seed`

Only for the purpose of backward compatibility, retrieves the old behavior of using the random seed

Attributes

precision

Precision of filter network.

Methods

<code>build(coord_, atype_, natoms, box_, mesh, ...)</code>	Build the computational graph for the descriptor.
<code>build_type_exclude_mask(exclude_types, ...)</code>	Build the type exclude mask for the descriptor.
<code>compute_input_stats(data_coord, data_box, ...)</code>	Compute the statistics (avg and std) of the training data.
<code>enable_compression(min_nbor_dist, graph, ...)</code>	Reveive the statistics (distance, max_nbor_size and env_mat_range) of the training data.
<code>enable_mixed_precision([mixed_prec])</code>	Reveive the mixed precision setting.
<code>get_dim_out()</code>	Returns the output dimension of this descriptor.
<code>get_dim_rot_mat_1()</code>	Returns the first dimension of the rotation matrix.
<code>get_feed_dict(coord_, atype_, natoms, box, mesh)</code>	Generate the feed_dict for current descriptor.
<code>get_nlist()</code>	Returns
<code>get_ntypes()</code>	Returns the number of atom types.
<code>get_rcut()</code>	Returns the cut-off radius.
<code>get_tensor_names([suffix])</code>	Get names of tensors.
<code>init_variables(graph, graph_def[, suffix])</code>	Init the embedding net variables with the given dict.
<code>merge_input_stats(stat_dict)</code>	Merge the statistics computed from compute_input_stats to obtain the self.davg and self.dstd.
<code>pass_tensors_from_frz_model(descrpt_reshape ...)</code>	Pass the descrpt_reshape tensor as well as descrpt_deriv tensor from the frz graph_def.
<code>prod_force_virial(atom_ener, natoms)</code>	Compute force and virial.
<code>register(key)</code>	Register a descriptor plugin.

`build(coord_: Tensor, atype_: Tensor, natoms: Tensor, box_: Tensor, mesh: Tensor, input_dict: dict, reuse: bool | None = None, suffix: str = '') → Tensor`

Build the computational graph for the descriptor.

Parameters

`coord_`
The coordinate of atoms

`atype_`
The type of atoms

`natoms`
The number of atoms. This tensor has the length of Ntypes + 2 `natoms[0]`: number of local atoms `natoms[1]`: total number of atoms held by this processor `natoms[i]`: $2 \leq i < \text{Ntypes} + 2$, number of type i atoms

`box_`
[`tf.Tensor`] The box of the system

`mesh`
For historical reasons, only the length of the Tensor matters. if size of mesh == 6, pbc is assumed. if size of mesh == 0, no-pbc is assumed.

`input_dict`
 Dictionary for additional inputs

`reuse`
 The weights in the networks should be reused when get the variable.

`suffix`
 Name suffix to identify this descriptor

Returns

descriptor
 The output descriptor

compute_input_stats(data_coord, data_box, data_atype, natoms_vec, mesh, input_dict)

Compute the statisitcs (avg and std) of the training data. The input will be normalized by the statistics.

Parameters

`data_coord`
 The coordinates. Can be generated by `deepmd.model.make_stat_input`

`data_box`
 The box. Can be generated by `deepmd.model.make_stat_input`

`data_atype`
 The atom types. Can be generated by `deepmd.model.make_stat_input`

`natoms_vec`
 The vector for the number of atoms of the system and different types of atoms.
 Can be generated by `deepmd.model.make_stat_input`

`mesh`
 The mesh for neighbor searching. Can be generated by
`deepmd.model.make_stat_input`

`input_dict`
 Dictionary for additional input

enable_compression(min_nbor_dist: float, graph: Graph, graph_def: GraphDef, table_extrapolate: float = 5, table_stride_1: float = 0.01, table_stride_2: float = 0.1, check_frequency: int = -1, suffix: str = '') → None

Reveive the statisitcs (distance, max_nbor_size and env_mat_range) of the training data.

Parameters

`min_nbor_dist`
 The nearest distance between atoms

`graph`
 [tf.Graph] The graph of the model

`graph_def`
 [tf.GraphDef] The graph_def of the model

`table_extrapolate`
 The scale of model extrapolation

`table_stride_1`
 The uniform stride of the first table

`table_stride_2`
The uniform stride of the second table

`check_frequency`
The overflow check frequency

`suffix`
[`str`, `optional`] The suffix of the scope

`get_dim_out()`
Returns the output dimension of this descriptor.

`get_nlist()`
Returns

`nlist`
Neighbor list

`rij`
The relative distance between the neighbor and the center atom.

`sel_a`
The number of neighbors with full information

`sel_r`
The number of neighbors with only radial information

`get_ntypes()`
Returns the number of atom types.

`get_rcut()`
Returns the cut-off radius.

`merge_input_stats(stat_dict)`
Merge the statisitcs computed from `compute_input_stats` to obtain the `self.davg` and `self.dstd`.

Parameters

`stat_dict`
The dict of statisitcs computed from `compute_input_stats`, including:

`sumr`
The sum of radial statisitcs.

`sumn`
The sum of neighbor numbers.

`sumr2`
The sum of square of radial statisitcs.

`prod_force_virial(atom_ener: Tensor, natoms: Tensor) → Tuple[Tensor, Tensor, Tensor]`
Compute force and virial.

Parameters

`atom_ener`
The atomic energy

natoms
 The number of atoms. This tensor has the length of Ntypes + 2 natoms[0]: number of local atoms natoms[1]: total number of atoms held by this processor natoms[i]: $2 \leq i < \text{Ntypes} + 2$, number of type i atoms

Returns

force
 The force on atoms

virial
 The total virial

atom_virial
 The atomic virial

deepmd.descriptor.se_t module

class deepmd.descriptor.se_t.DescriptSeT(*args, **kwargs)

Bases: *DescriptSe*

DeepPot-SE constructed from all information (both angular and radial) of atomic configurations.

The embedding takes angles between two neighboring atoms as input.

Parameters

rcut
 The cut-off radius

rcut_smth
 From where the environment matrix should be smoothed

sel
`[list[str]]` sel[i] specifies the maximum number of type i atoms in the cut-off radius

neuron
`[list[int]]` Number of neurons in each hidden layers of the embedding net

resnet_dt
 Time-step dt in the resnet construction: $y = x + dt * \phi(Wx + b)$

trainable
 If the weights of embedding net are trainable.

seed
 Random seed for initializing the network parameters.

set_davg_zero
 Set the shift of embedding net input to zero.

activation_function
 The activation function in the embedding net. Supported options are “relu”, “relu6”, “softplus”, “sigmoid”, “tanh”, “gelu”, “gelu_tf”, “None”, “none”.

precision
 The precision of the embedding net parameters. Supported options are “default”, “float16”, “float32”, “float64”, “bfloat16”.

uniform_seed
 Only for the purpose of backward compatibility, retrieves the old behavior of using the random seed

Attributes

precision

Precision of filter network.

Methods

<i>build</i> (coord_, atype_, natoms, box_, mesh, ...)	Build the computational graph for the descriptor.
<i>build_type_exclude_mask</i> (exclude_types, ...)	Build the type exclude mask for the descriptor.
<i>compute_input_stats</i> (data_coord, data_box, ...)	Compute the statistics (avg and std) of the training data.
<i>enable_compression</i> (min_nbor_dist, graph, ...)	Reveive the statistics (distance, max_nbor_size and env_mat_range) of the training data.
<i>enable_mixed_precision</i> ([mixed_prec])	Reveive the mixed precision setting.
<i>get_dim_out</i> ()	Returns the output dimension of this descriptor.
<i>get_dim_rot_mat_1</i> ()	Returns the first dimension of the rotation matrix.
<i>get_feed_dict</i> (coord_, atype_, natoms, box, mesh)	Generate the feed_dict for current descriptor.
<i>get_nlist</i> ()	Returns
<i>get_ntypes</i> ()	Returns the number of atom types.
<i>get_rcut</i> ()	Returns the cut-off radius.
<i>get_tensor_names</i> ([suffix])	Get names of tensors.
<i>init_variables</i> (graph, graph_def[, suffix])	Init the embedding net variables with the given dict.
<i>merge_input_stats</i> (stat_dict)	Merge the statistics computed from compute_input_stats to obtain the self.davg and self.dstd.
<i>pass_tensors_from_frz_model</i> (descript_reshape ...)	Pass the descript_reshape tensor as well as descript_deriv tensor from the frz graph_def.
<i>prod_force_virial</i> (atom_ener, natoms)	Compute force and virial.
<i>register</i> (key)	Register a descriptor plugin.

build(coord_: Tensor, atype_: Tensor, natoms: Tensor, box_: Tensor, mesh: Tensor, input_dict: dict, reuse: bool | None = None, suffix: str = '') → Tensor

Build the computational graph for the descriptor.

Parameters

coord_

The coordinate of atoms

atype_

The type of atoms

natoms

The number of atoms. This tensor has the length of Ntypes + 2 natoms[0]: number of local atoms natoms[1]: total number of atoms held by this processor natoms[i]: 2 ≤ i < Ntypes+2, number of type i atoms

box_

[tf.Tensor] The box of the system

mesh
For historical reasons, only the length of the Tensor matters. if size of mesh == 6, pbc is assumed. if size of mesh == 0, no-pbc is assumed.

input_dict
Dictionary for additional inputs

reuse
The weights in the networks should be reused when get the variable.

suffix
Name suffix to identify this descriptor

Returns

descriptor
The output descriptor

compute_input_stats(data_coord: list, data_box: list, data_atype: list, natoms_vec: list, mesh: list, input_dict: dict) → None

Compute the statisitcs (avg and std) of the training data. The input will be normalized by the statistics.

Parameters

data_coord
The coordinates. Can be generated by deepmd.model.make_stat_input

data_box
The box. Can be generated by deepmd.model.make_stat_input

data_atype
The atom types. Can be generated by deepmd.model.make_stat_input

natoms_vec
The vector for the number of atoms of the system and different types of atoms.
Can be generated by deepmd.model.make_stat_input

mesh
The mesh for neighbor searching. Can be generated by deepmd.model.make_stat_input

input_dict
Dictionary for additional input

enable_compression(min_nbor_dist: float, graph: Graph, graph_def: GraphDef, table_extrapolate: float = 5, table_stride_1: float = 0.01, table_stride_2: float = 0.1, check_frequency: int = -1, suffix: str = '') → None

Reveive the statisitcs (distance, max_nbor_size and env_mat_range) of the training data.

Parameters

min_nbor_dist
The nearest distance between atoms

graph
[tf.Graph] The graph of the model

graph_def
[tf.GraphDef] The graph_def of the model

table_extrapolate
The scale of model extrapolation

`table_stride_1`
The uniform stride of the first table

`table_stride_2`
The uniform stride of the second table

`check_frequency`
The overflow check frequency

`suffix`
[`str`, `optional`] The suffix of the scope

`get_dim_out()` → `int`

Returns the output dimension of this descriptor.

`get_nlist()` → `Tuple`[`Tensor`, `Tensor`, `List`[`int`], `List`[`int`]]

Returns

`nlist`
Neighbor list

`rij`
The relative distance between the neighbor and the center atom.

`sel_a`
The number of neighbors with full information

`sel_r`
The number of neighbors with only radial information

`get_ntypes()` → `int`

Returns the number of atom types.

`get_rcut()` → `float`

Returns the cut-off radius.

`merge_input_stats`(`stat_dict`)

Merge the statisitcs computed from `compute_input_stats` to obtain the `self.davg` and `self.dstd`.

Parameters

`stat_dict`
The dict of statisitcs computed from `compute_input_stats`, including:

`sumr`
The sum of radial statisitcs.

`suma`
The sum of relative coord statisitcs.

`sumn`
The sum of neighbor numbers.

`sumr2`
The sum of square of radial statisitcs.

`suma2`
The sum of square of relative coord statisitcs.

`prod_force_virial(atom_ener: Tensor, natoms: Tensor) → Tuple[Tensor, Tensor, Tensor]`

Compute force and virial.

Parameters

`atom_ener`

The atomic energy

`natoms`

The number of atoms. This tensor has the length of `Ntypes + 2`: `natoms[0]`: number of local atoms `natoms[1]`: total number of atoms held by this processor `natoms[i]`: $2 \leq i < Ntypes + 2$, number of type `i` atoms

Returns

`force`

The force on atoms

`virial`

The total virial

`atom_virial`

The atomic virial

deepmd.entrypoints package

Submodule that contains all the DeePMD-Kit entry point scripts.

`deepmd.entrypoints.compress(*, input: str, output: str, extrapolate: int, step: float, frequency: str, checkpoint_folder: str, training_script: str, mpi_log: str, log_path: str | None, log_level: int, **kwargs)`

Compress model.

The table is composed of fifth-order polynomial coefficients and is assembled from two sub-tables. The first table takes the step parameter as the domain's uniform step size, while the second table takes `10 * step` as its uniform step size. The range of the first table is automatically detected by the code, while the second table ranges from the first table's upper boundary(`upper`) to the `extrapolate(parameter) * upper`.

Parameters

`input`

[`str`] frozen model file to compress

`output`

[`str`] compressed model filename

`extrapolate`

[`int`] scale of model extrapolation

`step`

[`float`] uniform step size of the tabulation's first table

`frequency`

[`str`] frequency of tabulation overflow check

`checkpoint_folder`

[`str`] training checkpoint folder for freezing

`training_script`

[`str`] training script of the input frozen model

```
mpi_log
    [str] mpi logging mode for training

log_path
    [Optional[str]] if speccified log will be written to this file

log_level
    [int] logging level

**kwargs
    additional arguments

deepmd.entrypoints.config(*, output: str, **kwargs)
    Auto config file generator.

    Parameters
        output
            [str] file to write config file

        **kwargs
            additional arguments

    Raises
        RuntimeError
            if user does not input any systems

        ValueError
            if output file is of wrong type

        **kwargs
            additional arguments

deepmd.entrypoints.convert(*, FROM: str, input_model: str, output_model: str, **kwargs)

deepmd.entrypoints.doc_train_input(*, out_type: str = 'rst', **kwargs)
    Print out trining input arguments to console.

deepmd.entrypoints.freeze(*, checkpoint_folder: str, output: str, node_names: str | None = None,
                           nvnmmd_weight: str | None = None, united_model: bool = False, **kwargs)
    Freeze the graph in supplied folder.

    Parameters
        checkpoint_folder
            [str] location of the folder with model

        output
            [str] output file name

        node_names
            [Optional[str], optional] names of nodes to output, by default None

        nvnmmd_weight
            [Optional[str], optional] nvnmmd weight file

        united_model
            [bool] when in multi-task mode, freeze all nodes into one unit model

        **kwargs
            other arguments
```

```
deepmd.entrypoints.make_model_devi(*, models: list, system: str, set_prefix: str, output: str, frequency:
                                int, **kwargs)
```

Make model deviation calculation.

Parameters

models
[list] A list of paths of models to use for making model deviation

system
[str] The path of system to make model deviation calculation

set_prefix
[str] The set prefix of the system

output
[str] The output file for model deviation results

frequency
[int] The number of steps that elapse between writing coordinates in a trajectory by a MD engine (such as Gromacs / Lammmps). This paramter is used to determine the index in the output file.

****kwargs**
Arbitrary keyword arguments.

```
deepmd.entrypoints.neighbor_stat(*, system: str, rcut: float, type_map: List[str], one_type: bool =
                                False, **kwargs)
```

Calculate neighbor statistics.

Parameters

system
[str] system to stat

rcut
[float] cutoff radius

type_map
[list[str]] type map

one_type
[bool, optional, default=False] treat all types as a single type

****kwargs**
additional arguments

Examples

```
>>> neighbor_stat(system='.', rcut=6., type_map=["C", "H", "O", "N", "P", "S", "Mg", "Na", "HW
↪", "OW", "mNa", "mCl", "mC", "mH", "mMg", "mN", "mO", "mP"])
min_nbor_dist: 0.6599510670195264
max_nbor_size: [23, 26, 19, 16, 2, 2, 1, 1, 72, 37, 5, 0, 31, 29, 1, 21, 20, 5]
```

```
deepmd.entrypoints.test(*, model: str, system: str, datafile: str, set_prefix: str, numb_test: int,
                        rand_seed: int | None, shuffle_test: bool, detail_file: str, atomic: bool,
                        **kwargs)
```

Test model predictions.

Parameters

model
 [str] path where model is stored

system
 [str] system directory

datafile
 [str] the path to the list of systems to test

set_prefix
 [str] string prefix of set

numb_test
 [int] munber of tests to do

rand_seed
 [Optional[int]] seed for random generator

shuffle_test
 [bool] whether to shuffle tests

detail_file
 [Optional[str]] file where test details will be output

atomic
 [bool] whether per atom quantities should be computed

**kwargs
 additional arguments

Raises

 RuntimeError
 if no valid system was found

deepmd.entrypoints.train_dp(*, INPUT: str, init_model: str | None, restart: str | None, output: str,
 init_frz_model: str, mpi_log: str, log_level: int, log_path: str | None,
 is_compress: bool = False, skip_neighbor_stat: bool = False, finetune: str
 | None = None, **kwargs)

Run DeePMD model training.

Parameters

INPUT
 [str] json/yaml control file

init_model
 [Optional[str]] path to checkpoint folder or None

restart
 [Optional[str]] path to checkpoint folder or None

output
 [str] path for dump file with arguments

init_frz_model
 [str] path to frozen model or None

mpi_log
 [str] mpi logging mode

log_level
 [int] logging level defined by int 0-3

```

log_path
    [Optional[str]] logging file path or None if logs are to be output only to stdout

is_compress
    [bool] indicates whether in the model compress mode

skip_neighbor_stat
    [bool, default=False] skip checking neighbor statistics

finetune
    [Optional[str]] path to pretrained model or None

**kwargs
    additional arguments

Raises
    RuntimeError
        if distributed training job name is wrong

deepmd.entrypoints.transfer(*, old_model: str, raw_model: str, output: str, **kwargs)
    Transfer operation from old from graph to new prepared raw graph.

Parameters
    old_model
        [str] frozen old graph model

    raw_model
        [str] new model that will accept ops from old model

    output
        [str] new model with transfered parameters will be saved to this location

    **kwargs
        additional arguments

```

Submodules

deepmd.entrypoints.compress module

Compress a model, which including tabulating the embedding-net.

```

deepmd.entrypoints.compress.compress(*, input: str, output: str, extrapolate: int, step: float,
                                     frequency: str, checkpoint_folder: str, training_script: str,
                                     mpi_log: str, log_path: str | None, log_level: int, **kwargs)

```

Compress model.

The table is composed of fifth-order polynomial coefficients and is assembled from two sub-tables. The first table takes the step parameter as the domain's uniform step size, while the second table takes 10 * step as it's uniform step size. The range of the first table is automatically detected by the code, while the second table ranges from the first table's upper boundary(upper) to the extrapolate(parameter) * upper.

Parameters

```

input
    [str] frozen model file to compress

output
    [str] compressed model filename

```

extrapolate
 [int] scale of model extrapolation

step
 [float] uniform step size of the tabulation's first table

frequency
 [str] frequency of tabulation overflow check

checkpoint_folder
 [str] training checkpoint folder for freezing

training_script
 [str] training script of the input frozen model

mpi_log
 [str] mpi logging mode for training

log_path
 [Optional[str]] if specified log will be written to this file

log_level
 [int] logging level

**kwargs
 additional arguments

deepmd.entrypoints.config module

Quickly create a configuration file for smooth model.

`deepmd.entrypoints.config.config(*, output: str, **kwargs)`

Auto config file generator.

Parameters

output
 [str] file to write config file

**kwargs
 additional arguments

Raises

RuntimeError
 if user does not input any systems

ValueError
 if output file is of wrong type

****kwargs**
 additional arguments

deepmd.entrypoints.convert module

```
deepmd.entrypoints.convert.convert(*, FROM: str, input_model: str, output_model: str, **kwargs)
```

deepmd.entrypoints.doc module

Module that prints train input arguments docstrings.

```
deepmd.entrypoints.doc.doc_train_input(*, out_type: str = 'rst', **kwargs)
```

Print out training input arguments to console.

deepmd.entrypoints.freeze module

Script for freezing TF trained graph so it can be used with LAMMPS and i-PI.

References

<https://blog.metaflow.fr/tensorflow-how-to-freeze-a-model-and-serve-it-with-a-python-api-d4f3596b3adc>

```
deepmd.entrypoints.freeze.freeze(*, checkpoint_folder: str, output: str, node_names: str | None =
                                None, nvnmmd_weight: str | None = None, united_model: bool =
                                False, **kwargs)
```

Freeze the graph in supplied folder.

Parameters

checkpoint_folder

[str] location of the folder with model

output

[str] output file name

node_names

[Optional[str], optional] names of nodes to output, by default None

nvnmmd_weight

[Optional[str], optional] nvnmmd weight file

united_model

[bool] when in multi-task mode, freeze all nodes into one unit model

**kwargs

other arguments

deepmd.entrypoints.ipi module**deepmd.entrypoints.main module**

DeePMD-Kit entry point module.

`deepmd.entrypoints.main.get_ll(log_level: str) → int`

Convert string to python logging level.

Parameters

`log_level`

`[str]` allowed input values are: DEBUG, INFO, WARNING, ERROR, 3, 2, 1, 0

Returns

`int`

one of python logging module log levels - 10, 20, 30 or 40

`deepmd.entrypoints.main.main(args: List[str] | None = None)`

DeePMD-Kit entry point.

Parameters

`args`

`[List[str], optional]` list of command line arguments, used to avoid calling from the subprocess, as it is quite slow to import tensorflow

Raises

`RuntimeError`

if no command was input

`deepmd.entrypoints.main.main_parser() → ArgumentParser`

DeePMD-Kit commandline options argument parser.

Returns

`argparse.ArgumentParser`

main parser of DeePMD-kit

`deepmd.entrypoints.main.parse_args(args: List[str] | None = None) → Namespace`

Parse arguments and convert argument strings to objects.

Parameters

`args`

`[List[str]]` list of command line arguments, main purpose is testing default option
None takes arguments from sys.argv

Returns

`argparse.Namespace`

the populated namespace

deepmd.entrypoints.neighbor_stat module

`deepmd.entrypoints.neighbor_stat.neighbor_stat(*, system: str, rcut: float, type_map: List[str], one_type: bool = False, **kwargs)`

Calculate neighbor statistics.

Parameters

system

[str] system to stat

rcut

[float] cutoff radius

type_map

[list[str]] type map

one_type

[bool, optional, default=False] treat all types as a single type

**kwargs

additional arguments

Examples

```
>>> neighbor_stat(system='.', rcut=6., type_map=["C", "H", "O", "N", "P", "S", "Mg", "Na", "HW", "OW", "mNa", "mCl", "mC", "mH", "mMg", "mN", "mO", "mP"])
min_nbor_dist: 0.6599510670195264
max_nbor_size: [23, 26, 19, 16, 2, 2, 1, 1, 72, 37, 5, 0, 31, 29, 1, 21, 20, 5]
```

deepmd.entrypoints.test module

Test trained DeePMD model.

`deepmd.entrypoints.test.test(*, model: str, system: str, datafile: str, set_prefix: str, numb_test: int, rand_seed: int | None, shuffle_test: bool, detail_file: str, atomic: bool, **kwargs)`

Test model predictions.

Parameters

model

[str] path where model is stored

system

[str] system directory

datafile

[str] the path to the list of systems to test

set_prefix

[str] string prefix of set

numb_test

[int] number of tests to do

rand_seed

[Optional[int]] seed for random generator

shuffle_test
 [bool] whether to shuffle tests

detail_file
 [Optional[str]] file where test details will be output

atomic
 [bool] whether per atom quantities should be computed

**kwargs
 additional arguments

Raises

 RuntimeError
 if no valid system was found

deepmd.entrypoints.train module

DeePMD training entrypoint script.

Can handle local or distributed training.

```
deepmd.entrypoints.train.train(*, INPUT: str, init_model: str | None, restart: str | None, output: str,  
                               init_frz_model: str, mpi_log: str, log_level: int, log_path: str | None,  
                               is_compress: bool = False, skip_neighbor_stat: bool = False, finetune:  
                               str | None = None, **kwargs)
```

Run DeePMD model training.

Parameters

INPUT
 [str] json/yaml control file

init_model
 [Optional[str]] path to checkpoint folder or None

restart
 [Optional[str]] path to checkpoint folder or None

output
 [str] path for dump file with arguments

init_frz_model
 [str] path to frozen model or None

mpi_log
 [str] mpi logging mode

log_level
 [int] logging level defined by int 0-3

log_path
 [Optional[str]] logging file path or None if logs are to be output only to stdout

is_compress
 [bool] indicates whether in the model compress mode

skip_neighbor_stat
 [bool, default=False] skip checking neighbor statistics

```

finetune
    [Optional[str]] path to pretrained model or None
**kwargs
    additional arguments

Raises
    RuntimeError
        if distributed training job name is wrong

```

deepmd.entrypoints.transfer module

Module used for transferring parameters between models.

```
deepmd.entrypoints.transfer.transfer(*, old_model: str, raw_model: str, output: str, **kwargs)
```

Transfer operation from old from graph to new prepared raw graph.

```

Parameters
    old_model
        [str] frozen old graph model
    raw_model
        [str] new model that will accept ops from old model
    output
        [str] new model with transfered parameters will be saved to this location
    **kwargs
        additional arguments

```

deepmd.fit package

```
class deepmd.fit.DipoleFittingSeA(descrpt: Tensor, neuron: List[int] = [120, 120, 120], resnet_dt: bool = True, sel_type: List[int] | None = None, seed: int | None = None, activation_function: str = 'tanh', precision: str = 'default', uniform_seed: bool = False)
```

Bases: *Fitting*

Fit the atomic dipole with descriptor se_a.

```

Parameters
    descrpt
        [tf.Tensor] The descriptor
    neuron
        [List[int]] Number of neurons in each hidden layer of the fitting net
    resnet_dt
        [bool] Time-step dt in the resnet construction:  $y = x + dt * \phi(Wx + b)$ 
    sel_type
        [List[int]] The atom types selected to have an atomic dipole prediction. If is None, all atoms are selected.
    seed
        [int] Random seed for initializing the network parameters.

```

activation_function

[[str](#)] The activation function in the embedding net. Supported options are “relu”, “relu6”, “softplus”, “sigmoid”, “tanh”, “gelu”, “gelu_tf”, “None”, “none”.

precision

[[str](#)] The precision of the embedding net parameters. Supported options are “default”, “float16”, “float32”, “float64”, “bfloat16”.

uniform_seed

Only for the purpose of backward compatibility, retrieves the old behavior of using the random seed

Attributes

precision

Precision of fitting network.

Methods

<i>build</i> (input_d, rot_mat, natoms[, ...])	Build the computational graph for fitting net.
<i>enable_mixed_precision</i> ([mixed_prec])	Reveive the mixed precision setting.
<i>get_out_size</i> ()	Get the output size.
<i>get_sel_type</i> ()	Get selected type.
<i>init_variables</i> (graph, graph_def[, suffix])	Init the fitting net variables with the given dict.

build(input_d: Tensor, rot_mat: Tensor, natoms: Tensor, input_dict: [dict](#) | [None](#) = None, reuse: [bool](#) | [None](#) = None, suffix: [str](#) = '') → Tensor

Build the computational graph for fitting net.

Parameters

input_d

The input descriptor

rot_mat

The rotation matrix from the descriptor.

natoms

The number of atoms. This tensor has the length of Ntypes + 2 natoms[0]: number of local atoms natoms[1]: total number of atoms held by this processor natoms[i]: 2 ≤ i < Ntypes+2, number of type i atoms

input_dict

Additional dict for inputs.

reuse

The weights in the networks should be reused when get the variable.

suffix

Name suffix to identify this descriptor

Returns

dipole

The atomic dipole.

`enable_mixed_precision(mixed_prec: dict | None = None) → None`

Reveive the mixed precision setting.

Parameters

`mixed_prec`

The mixed precision setting used in the embedding net

`get_out_size() → int`

Get the output size. Should be 3.

`get_sel_type() → int`

Get selected type.

`init_variables(graph: Graph, graph_def: GraphDef, suffix: str = '') → None`

Init the fitting net variables with the given dict.

Parameters

`graph`

[`tf.Graph`] The input frozen model graph

`graph_def`

[`tf.GraphDef`] The input frozen model graph_def

`suffix`

[`str`] suffix to name scope

```
class deepmd.fit.EnerFitting(descrpt: Tensor, neuron: List[int] = [120, 120, 120], resnet_dt: bool =
    True, numb_fparam: int = 0, numb_aparam: int = 0, rcond: float =
    0.001, tot_ener_zero: bool = False, trainable: List[bool] | None = None,
    seed: int | None = None, atom_ener: List[float] = [], activation_function:
    str = 'tanh', precision: str = 'default', uniform_seed: bool = False,
    layer_name: List[str | None] | None = None, use_aparam_as_mask: bool
    = False)
```

Bases: *Fitting*

Fitting the energy of the system. The force and the virial can also be trained.

The potential energy E is a fitting network function of the descriptor \mathcal{D} :

$$E(\mathcal{D}) = \mathcal{L}^{(n)} \circ \mathcal{L}^{(n-1)} \circ \dots \circ \mathcal{L}^{(1)} \circ \mathcal{L}^{(0)}$$

The first n hidden layers $\mathcal{L}^{(0)}, \dots, \mathcal{L}^{(n-1)}$ are given by

$$y = \mathcal{L}(x; w, b) = \phi(x^T w + b)$$

where $x \in \mathbb{R}^{N_1}$ is the input vector and $y \in \mathbb{R}^{N_2}$ is the output vector. $w \in \mathbb{R}^{N_1 \times N_2}$ and $b \in \mathbb{R}^{N_2}$ are weights and biases, respectively, both of which are trainable if `trainable[i]` is True. ϕ is the activation function.

The output layer $\mathcal{L}^{(n)}$ is given by

$$y = \mathcal{L}^{(n)}(x; w, b) = x^T w + b$$

where $x \in \mathbb{R}^{N_{n-1}}$ is the input vector and $y \in \mathbb{R}$ is the output scalar. $w \in \mathbb{R}^{N_{n-1}}$ and $b \in \mathbb{R}$ are weights and bias, respectively, both of which are trainable if `trainable[n]` is True.

Parameters

descript
The descriptor \mathcal{D}

neuron
Number of neurons N in each hidden layer of the fitting net

resnet_dt
Time-step dt in the resnet construction: $y = x + dt * \phi(Wx + b)$

numb_fparam
Number of frame parameter

numb_aparam
Number of atomic parameter

rcond
The condition number for the regression of atomic energy.

tot_ener_zero
Force the total energy to zero. Useful for the charge fitting.

trainable
If the weights of fitting net are trainable. Suppose that we have N_l hidden layers in the fitting net, this list is of length $N_l + 1$, specifying if the hidden layers and the output layer are trainable.

seed
Random seed for initializing the network parameters.

atom_ener
Specifying atomic energy contribution in vacuum. The `set_davg_zero` key in the descriptor should be set.

activation_function
The activation function ϕ in the embedding net. Supported options are “relu”, “relu6”, “softplus”, “sigmoid”, “tanh”, “gelu”, “gelu_tf”, “None”, “none”.

precision
The precision of the embedding net parameters. Supported options are “default”, “float16”, “float32”, “float64”, “bfloat16”.

uniform_seed
Only for the purpose of backward compatibility, retrieves the old behavior of using the random seed

layer_name
[`list`[`Optional`[`str`]], `optional`] The name of the each layer. If two layers, either in the same fitting or different fittings, have the same name, they will share the same neural network parameters.

use_aparam_as_mask: `bool`, `optional`
If `True`, the atomic parameters will be used as a mask that determines the atom is real/virtual. And the `aparam` will not be used as the atomic parameters for embedding.

Attributes

precision
Precision of fitting network.

Methods

<code>build(inputs, natoms[, input_dict, reuse, ...])</code>	Build the computational graph for fitting net.
<code>change_energy_bias(data, frozen_model, ...)</code>	Change the energy bias according to the input data and the pretrained model.
<code>compute_input_stats(all_stat[, protection])</code>	Compute the input statistics.
<code>compute_output_stats(all_stat[, mixed_type])</code>	Compute the output statistics.
<code>enable_mixed_precision([mixed_prec])</code>	Reveive the mixed precision setting.
<code>get_numb_aparam()</code>	Get the number of atomic parameters.
<code>get_numb_fparam()</code>	Get the number of frame parameters.
<code>init_variables(graph, graph_def[, suffix])</code>	Init the fitting net variables with the given dict.

build(inputs: Tensor, natoms: Tensor, input_dict: dict | None = None, reuse: bool | None = None, suffix: str = '') → Tensor

Build the computational graph for fitting net.

Parameters

inputs

The input descriptor

input_dict

Additional dict for inputs. if numb_fparam > 0, should have input_dict['fparam']
if numb_aparam > 0, should have input_dict['aparam']

natoms

The number of atoms. This tensor has the length of Ntypes + 2 natoms[0]: number of local atoms natoms[1]: total number of atoms held by this processor natoms[i]: 2 ≤ i < Ntypes+2, number of type i atoms

reuse

The weights in the networks should be reused when get the variable.

suffix

Name suffix to identify this descriptor

Returns

ener

The system energy

change_energy_bias(data, frozen_model, origin_type_map, full_type_map, bias_shift='delta', ntest=10) → None

Change the energy bias according to the input data and the pretrained model.

Parameters

data

[DeepmdDataSystem] The training data.

frozen_model

[str] The path file of frozen model.

origin_type_map

[list] The original type_map in dataset, they are targets to change the energy bias.

full_type_map

[str] The full type_map in pretrained model

`bias_shift`
 [`str`] The mode for changing energy bias : [`'delta'`, `'statistic'`] `'delta'` : perform predictions on energies of target dataset,
 and do least square on the errors to obtain the target shift as bias.
`'statistic'` : directly use the statistic energy bias in the target dataset.

`ntest`
 [`int`] The number of test samples in a system to change the energy bias.

`compute_input_stats`(all_stat: `dict`, protection: `float` = 0.01) → `None`
 Compute the input statistics.

Parameters

`all_stat`
 if `numb_fparam` > 0 must have `all_stat['fparam']` if `numb_aparam` > 0 must have `all_stat['aparam']` can be prepared by `model.make_stat_input`

`protection`
 Divided-by-zero protection

`compute_output_stats`(all_stat: `dict`, mixed_type: `bool` = False) → `None`
 Compute the output statistics.

Parameters

`all_stat`
 must have the following components: `all_stat['energy']` of shape `n_sys x n_batch x n_frame` can be prepared by `model.make_stat_input`

`mixed_type`
 Whether to perform the mixed_type mode. If True, the input data has the mixed_type format (see doc/model/train_se_atten.md), in which frames in a system may have different `natoms_vec(s)`, with the same `nloc`.

`enable_mixed_precision`(mixed_prec: `dict` | `None` = None) → `None`
 Receive the mixed precision setting.

Parameters

`mixed_prec`
 The mixed precision setting used in the embedding net

`get_numb_aparam`() → `int`
 Get the number of atomic parameters.

`get_numb_fparam`() → `int`
 Get the number of frame parameters.

`init_variables`(graph: `Graph`, graph_def: `GraphDef`, suffix: `str` = "") → `None`
 Init the fitting net variables with the given dict.

Parameters

`graph`
 [`tf.Graph`] The input frozen model graph

`graph_def`
 [`tf.GraphDef`] The input frozen model graph_def

```

    suffix
    [str] suffix to name scope
class deepmd.fit.GlobalPolarFittingSeA(descrpt: Tensor, neuron: List[int] = [120, 120, 120],
    resnet_dt: bool = True, sel_type: List[int] | None = None,
    fit_diag: bool = True, scale: List[float] | None = None,
    diag_shift: List[float] | None = None, seed: int | None = None,
    activation_function: str = 'tanh', precision: str = 'default')

Bases: object

Fit the system polarizability with descriptor se_a.

Parameters
    descrpt
    [tf.Tensor] The descriptor

    neuron
    [List[int]] Number of neurons in each hidden layer of the fitting net

    resnet_dt
    [bool] Time-step dt in the resnet construction:  $y = x + dt * \phi(Wx + b)$ 

    sel_type
    [List[int]] The atom types selected to have an atomic polarizability prediction

    fit_diag
    [bool] Fit the diagonal part of the rotational invariant polarizability matrix, which
    will be converted to normal polarizability matrix by contracting with the rotation
    matrix.

    scale
    [List[float]] The output of the fitting net (polarizability matrix) for type i atom
    will be scaled by scale[i]

    diag_shift
    [List[float]] The diagonal part of the polarizability matrix of type i will be shifted
    by diag_shift[i]. The shift operation is carried out after scale.

    seed
    [int] Random seed for initializing the network parameters.

    activation_function
    [str] The activation function in the embedding net. Supported options are "relu",
    "relu6", "softplus", "sigmoid", "tanh", "gelu", "gelu_tf", "None", "none".

    precision
    [str] The precision of the embedding net parameters. Supported options are "de-
    fault", "float16", "float32", "float64", "bfloat16".

```

Methods

<i>build</i> (input_d, rot_mat, natoms[, ...])	Build the computational graph for fitting net.
<i>enable_mixed_precision</i> ([mixed_prec])	Reveive the mixed precision setting.
<i>get_out_size</i> ()	Get the output size.
<i>get_sel_type</i> ()	Get selected atom types.
<i>init_variables</i> (graph, graph_def[, suffix])	Init the fitting net variables with the given dict.

build(input_d, rot_mat, natoms, input_dict: dict | None = None, reuse=None, suffix='') → Tensor

Build the computational graph for fitting net.

Parameters

input_d

The input descriptor

rot_mat

The rotation matrix from the descriptor.

natoms

The number of atoms. This tensor has the length of Ntypes + 2 natoms[0]: number of local atoms natoms[1]: total number of atoms held by this processor natoms[i]: 2 ≤ i < Ntypes+2, number of type i atoms

input_dict

Additional dict for inputs.

reuse

The weights in the networks should be reused when get the variable.

suffix

Name suffix to identify this descriptor

Returns

polar

The system polarizability

enable_mixed_precision(mixed_prec: dict | None = None) → None

Reveive the mixed precision setting.

Parameters

mixed_prec

The mixed precision setting used in the embedding net

get_out_size() → int

Get the output size. Should be 9.

get_sel_type() → int

Get selected atom types.

init_variables(graph: Graph, graph_def: GraphDef, suffix: str = '') → None

Init the fitting net variables with the given dict.

Parameters

graph

[tf.Graph] The input frozen model graph

```

graph_def
    [tf.GraphDef] The input frozen model graph_def
suffix
    [str] suffix to name scope
class deepmd.fit.PolarFittingSeA(descript: Tensor, neuron: List[int] = [120, 120, 120], resnet_dt: bool
                                = True, sel_type: List[int] | None = None, fit_diag: bool = True,
                                scale: List[float] | None = None, shift_diag: bool = True, seed: int |
                                None = None, activation_function: str = 'tanh', precision: str =
                                'default', uniform_seed: bool = False)

```

Bases: *Fitting*

Fit the atomic polarizability with descriptor se_a.

Parameters

```

descript
    [tf.Tensor] The descriptor
neuron
    [List[int]] Number of neurons in each hidden layer of the fitting net
resnet_dt
    [bool] Time-step dt in the resnet construction:  $y = x + dt * \phi(Wx + b)$ 
sel_type
    [List[int]] The atom types selected to have an atomic polarizability prediction. If
    is None, all atoms are selected.
fit_diag
    [bool] Fit the diagonal part of the rotational invariant polarizability matrix, which
    will be converted to normal polarizability matrix by contracting with the rotation
    matrix.
scale
    [List[float]] The output of the fitting net (polarizability matrix) for type i atom
    will be scaled by scale[i]
diag_shift
    [List[float]] The diagonal part of the polarizability matrix of type i will be shifted
    by diag_shift[i]. The shift operation is carried out after scale.
seed
    [int] Random seed for initializing the network parameters.
activation_function
    [str] The activation function in the embedding net. Supported options are "relu",
    "relu6", "softplus", "sigmoid", "tanh", "gelu", "gelu_tf", "None", "none".
precision
    [str] The precision of the embedding net parameters. Supported options are "de-
    fault", "float16", "float32", "float64", "bfloat16".
uniform_seed
    Only for the purpose of backward compatibility, retrieves the old behavior of using
    the random seed

```

Attributes

```

precision
    Precision of fitting network.

```

Methods

<i>build</i> (input_d, rot_mat, natoms[, ...])	Build the computational graph for fitting net.
<i>compute_input_stats</i> (all_stat[, protection])	Compute the input statistics.
<i>enable_mixed_precision</i> ([mixed_prec])	Reveive the mixed precision setting.
<i>get_out_size</i> ()	Get the output size.
<i>get_sel_type</i> ()	Get selected atom types.
<i>init_variables</i> (graph, graph_def[, suffix])	Init the fitting net variables with the given dict.

build(input_d: Tensor, rot_mat: Tensor, natoms: Tensor, input_dict: dict | None = None, reuse: bool | None = None, suffix: str = '')

Build the computational graph for fitting net.

Parameters

input_d

The input descriptor

rot_mat

The rotation matrix from the descriptor.

natoms

The number of atoms. This tensor has the length of Ntypes + 2 natoms[0]: number of local atoms natoms[1]: total number of atoms held by this processor natoms[i]: 2 ≤ i < Ntypes+2, number of type i atoms

input_dict

Additional dict for inputs.

reuse

The weights in the networks should be reused when get the variable.

suffix

Name suffix to identify this descriptor

Returns

atomic_polar

The atomic polarizability

compute_input_stats(all_stat, protection=0.01)

Compute the input statistics.

Parameters

all_stat

Dictionary of inputs. can be prepared by model.make_stat_input

protection

Divided-by-zero protection

enable_mixed_precision(mixed_prec: dict | None = None) → None

Reveive the mixed precision setting.

Parameters

mixed_prec

The mixed precision setting used in the embedding net

`get_out_size() → int`

Get the output size. Should be 9.

`get_sel_type() → List[int]`

Get selected atom types.

`init_variables(graph: Graph, graph_def: GraphDef, suffix: str = '') → None`

Init the fitting net variables with the given dict.

Parameters

`graph`

[`tf.Graph`] The input frozen model graph

`graph_def`

[`tf.GraphDef`] The input frozen model graph_def

`suffix`

[`str`] suffix to name scope

Submodules

deepmd.fit.dipole module

```
class deepmd.fit.dipole.DipoleFittingSeA(descrpt: Tensor, neuron: List[int] = [120, 120, 120],
                                         resnet_dt: bool = True, sel_type: List[int] | None = None,
                                         seed: int | None = None, activation_function: str = 'tanh',
                                         precision: str = 'default', uniform_seed: bool = False)
```

Bases: *Fitting*

Fit the atomic dipole with descriptor se_a.

Parameters

`descrpt`

[`tf.Tensor`] The descriptor

`neuron`

[`List[int]`] Number of neurons in each hidden layer of the fitting net

`resnet_dt`

[`bool`] Time-step dt in the resnet construction: $y = x + dt * \phi(Wx + b)$

`sel_type`

[`List[int]`] The atom types selected to have an atomic dipole prediction. If is None, all atoms are selected.

`seed`

[`int`] Random seed for initializing the network parameters.

`activation_function`

[`str`] The activation function in the embedding net. Supported options are “relu”, “relu6”, “softplus”, “sigmoid”, “tanh”, “gelu”, “gelu_tf”, “None”, “none”.

`precision`

[`str`] The precision of the embedding net parameters. Supported options are “default”, “float16”, “float32”, “float64”, “bfloat16”.

`uniform_seed`

Only for the purpose of backward compatibility, retrieves the old behavior of using the random seed

Attributes

precision

Precision of fitting network.

Methods

<code>build(input_d, rot_mat, natoms[, ...])</code>	Build the computational graph for fitting net.
<code>enable_mixed_precision([mixed_prec])</code>	Reveive the mixed precision setting.
<code>get_out_size()</code>	Get the output size.
<code>get_sel_type()</code>	Get selected type.
<code>init_variables(graph, graph_def[, suffix])</code>	Init the fitting net variables with the given dict.

build(input_d: Tensor, rot_mat: Tensor, natoms: Tensor, input_dict: dict | None = None, reuse: bool | None = None, suffix: str = '') → Tensor

Build the computational graph for fitting net.

Parameters

`input_d`

The input descriptor

`rot_mat`

The rotation matrix from the descriptor.

`natoms`

The number of atoms. This tensor has the length of Ntypes + 2 `natoms[0]`: number of local atoms `natoms[1]`: total number of atoms held by this processor `natoms[i]`: $2 \leq i < \text{Ntypes} + 2$, number of type *i* atoms

`input_dict`

Additional dict for inputs.

`reuse`

The weights in the networks should be reused when get the variable.

`suffix`

Name suffix to identify this descriptor

Returns

dipole

The atomic dipole.

enable_mixed_precision(mixed_prec: dict | None = None) → None

Reveive the mixed precision setting.

Parameters

`mixed_prec`

The mixed precision setting used in the embedding net

get_out_size() → int

Get the output size. Should be 3.

`get_sel_type() → int`

Get selected type.

`init_variables(graph: Graph, graph_def: GraphDef, suffix: str = '') → None`

Init the fitting net variables with the given dict.

Parameters

`graph`

[`tf.Graph`] The input frozen model graph

`graph_def`

[`tf.GraphDef`] The input frozen model graph_def

`suffix`

[`str`] suffix to name scope

deepmd.fit.ener module

```
class deepmd.fit.ener.EnerFitting(descrpt: Tensor, neuron: List[int] = [120, 120, 120], resnet_dt: bool
    = True, numb_fparam: int = 0, numb_aparam: int = 0, rcond:
    float = 0.001, tot_ener_zero: bool = False, trainable: List[bool] |
    None = None, seed: int | None = None, atom_ener: List[float] = [],
    activation_function: str = 'tanh', precision: str = 'default',
    uniform_seed: bool = False, layer_name: List[str | None] | None =
    None, use_aparam_as_mask: bool = False)
```

Bases: *Fitting*

Fitting the energy of the system. The force and the virial can also be trained.

The potential energy E is a fitting network function of the descriptor \mathcal{D} :

$$E(\mathcal{D}) = \mathcal{L}^{(n)} \circ \mathcal{L}^{(n-1)} \circ \dots \circ \mathcal{L}^{(1)} \circ \mathcal{L}^{(0)}$$

The first n hidden layers $\mathcal{L}^{(0)}, \dots, \mathcal{L}^{(n-1)}$ are given by

$$y = \mathcal{L}(x; w, b) = \phi(x^T w + b)$$

where $x \in \mathbb{R}^{N_1}$ is the input vector and $y \in \mathbb{R}^{N_2}$ is the output vector. $w \in \mathbb{R}^{N_1 \times N_2}$ and $b \in \mathbb{R}^{N_2}$ are weights and biases, respectively, both of which are trainable if `trainable[i]` is True. ϕ is the activation function.

The output layer $\mathcal{L}^{(n)}$ is given by

$$y = \mathcal{L}^{(n)}(x; w, b) = x^T w + b$$

where $x \in \mathbb{R}^{N_{n-1}}$ is the input vector and $y \in \mathbb{R}$ is the output scalar. $w \in \mathbb{R}^{N_{n-1}}$ and $b \in \mathbb{R}$ are weights and bias, respectively, both of which are trainable if `trainable[n]` is True.

Parameters

`descrpt`

The descriptor \mathcal{D}

`neuron`

Number of neurons N in each hidden layer of the fitting net

`resnet_dt`

Time-step dt in the resnet construction: $y = x + dt * \phi(Wx + b)$

`numb_fparam`
Number of frame parameter

`numb_aparam`
Number of atomic parameter

`rcond`
The condition number for the regression of atomic energy.

`tot_ener_zero`
Force the total energy to zero. Useful for the charge fitting.

`trainable`
If the weights of fitting net are trainable. Suppose that we have N_l hidden layers in the fitting net, this list is of length $N_l + 1$, specifying if the hidden layers and the output layer are trainable.

`seed`
Random seed for initializing the network parameters.

`atom_ener`
Specifying atomic energy contribution in vacuum. The `set_davg_zero` key in the descriptor should be set.

`activation_function`
The activation function ϕ in the embedding net. Supported options are “relu”, “relu6”, “softplus”, “sigmoid”, “tanh”, “gelu”, “gelu_tf”, “None”, “none”.

`precision`
The precision of the embedding net parameters. Supported options are “default”, “float16”, “float32”, “float64”, “bfloat16”.

`uniform_seed`
Only for the purpose of backward compatibility, retrieves the old behavior of using the random seed

`layer_name`
[`list`[`Optional`[`str`]], `optional`] The name of the each layer. If two layers, either in the same fitting or different fittings, have the same name, they will share the same neural network parameters.

`use_aparam_as_mask`: bool, optional
If True, the atomic parameters will be used as a mask that determines the atom is real/virtual. And the aparam will not be used as the atomic parameters for embedding.

Attributes

precision
Precision of fitting network.

Methods

<code>build(inputs, natoms[, input_dict, reuse, ...])</code>	Build the computational graph for fitting net.
<code>change_energy_bias(data, frozen_model, ...)</code>	Change the energy bias according to the input data and the pretrained model.
<code>compute_input_stats(all_stat[, protection])</code>	Compute the input statistics.
<code>compute_output_stats(all_stat[, mixed_type])</code>	Compute the output statistics.
<code>enable_mixed_precision([mixed_prec])</code>	Reveive the mixed precision setting.
<code>get_numb_aparam()</code>	Get the number of atomic parameters.
<code>get_numb_fparam()</code>	Get the number of frame parameters.
<code>init_variables(graph, graph_def[, suffix])</code>	Init the fitting net variables with the given dict.

build(inputs: Tensor, natoms: Tensor, input_dict: dict | None = None, reuse: bool | None = None, suffix: str = '') → Tensor

Build the computational graph for fitting net.

Parameters

inputs

The input descriptor

input_dict

Additional dict for inputs. if numb_fparam > 0, should have input_dict['fparam']
if numb_aparam > 0, should have input_dict['aparam']

natoms

The number of atoms. This tensor has the length of Ntypes + 2 natoms[0]: number of local atoms natoms[1]: total number of atoms held by this processor natoms[i]: 2 ≤ i < Ntypes+2, number of type i atoms

reuse

The weights in the networks should be reused when get the variable.

suffix

Name suffix to identify this descriptor

Returns

ener

The system energy

change_energy_bias(data, frozen_model, origin_type_map, full_type_map, bias_shift='delta', ntest=10) → None

Change the energy bias according to the input data and the pretrained model.

Parameters

data

[DeepmdDataSystem] The training data.

frozen_model

[str] The path file of frozen model.

origin_type_map

[list] The original type_map in dataset, they are targets to change the energy bias.

full_type_map

[str] The full type_map in pretrained model

`bias_shift`
 [`str`] The mode for changing energy bias : [`'delta'`, `'statistic'`] `'delta'` : perform predictions on energies of target dataset,
 and do least square on the errors to obtain the target shift as bias.
`'statistic'` : directly use the statistic energy bias in the target dataset.

`ntest`
 [`int`] The number of test samples in a system to change the energy bias.

`compute_input_stats`(all_stat: `dict`, protection: `float` = 0.01) → `None`
 Compute the input statistics.

Parameters

`all_stat`
 if `numb_fparam` > 0 must have `all_stat['fparam']` if `numb_aparam` > 0 must have `all_stat['aparam']` can be prepared by `model.make_stat_input`

`protection`
 Divided-by-zero protection

`compute_output_stats`(all_stat: `dict`, mixed_type: `bool` = False) → `None`
 Compute the output statistics.

Parameters

`all_stat`
 must have the following components: `all_stat['energy']` of shape `n_sys x n_batch x n_frame` can be prepared by `model.make_stat_input`

`mixed_type`
 Whether to perform the mixed_type mode. If True, the input data has the mixed_type format (see doc/model/train_se_atten.md), in which frames in a system may have different `natoms_vec(s)`, with the same `nloc`.

`enable_mixed_precision`(mixed_prec: `dict` | `None` = None) → `None`
 Receive the mixed precision setting.

Parameters

`mixed_prec`
 The mixed precision setting used in the embedding net

`get_numb_aparam`() → `int`
 Get the number of atomic parameters.

`get_numb_fparam`() → `int`
 Get the number of frame parameters.

`init_variables`(graph: `Graph`, graph_def: `GraphDef`, suffix: `str` = "") → `None`
 Init the fitting net variables with the given dict.

Parameters

`graph`
 [`tf.Graph`] The input frozen model graph

`graph_def`
 [`tf.GraphDef`] The input frozen model graph_def

suffix
 [str] suffix to name scope

deepmd.fit.fitting module

class deepmd.fit.fitting.Fitting

Bases: object

Attributes

precision
 Precision of fitting network.

Methods

<i>init_variables</i> (graph, graph_def[, suffix])	Init the fitting net variables with the given dict.
--	---

init_variables(graph: Graph, graph_def: GraphDef, suffix: str = '') → None

Init the fitting net variables with the given dict.

Parameters

graph
 [tf.Graph] The input frozen model graph
 graph_def
 [tf.GraphDef] The input frozen model graph_def
 suffix
 [str] suffix to name scope

Notes

This method is called by others when the fitting supported initialization from the given variables.

property precision: DType

Precision of fitting network.

deepmd.fit.polar module

class deepmd.fit.polar.GlobalPolarFittingSeA(descrpt: Tensor, neuron: List[int] = [120, 120, 120], resnet_dt: bool = True, sel_type: List[int] | None = None, fit_diag: bool = True, scale: List[float] | None = None, diag_shift: List[float] | None = None, seed: int | None = None, activation_function: str = 'tanh', precision: str = 'default')

Bases: object

Fit the system polarizability with descriptor se_a.

Parameters

`descript`
`[tf.Tensor]` The descriptor

`neuron`
`[List[int]]` Number of neurons in each hidden layer of the fitting net

`resnet_dt`
`[bool]` Time-step dt in the resnet construction: $y = x + dt * \phi(Wx + b)$

`sel_type`
`[List[int]]` The atom types selected to have an atomic polarizability prediction

`fit_diag`
`[bool]` Fit the diagonal part of the rotational invariant polarizability matrix, which will be converted to normal polarizability matrix by contracting with the rotation matrix.

`scale`
`[List[float]]` The output of the fitting net (polarizability matrix) for type i atom will be scaled by `scale[i]`

`diag_shift`
`[List[float]]` The diagonal part of the polarizability matrix of type i will be shifted by `diag_shift[i]`. The shift operation is carried out after scale.

`seed`
`[int]` Random seed for initializing the network parameters.

`activation_function`
`[str]` The activation function in the embedding net. Supported options are “relu”, “relu6”, “softplus”, “sigmoid”, “tanh”, “gelu”, “gelu_tf”, “None”, “none”.

`precision`
`[str]` The precision of the embedding net parameters. Supported options are “default”, “float16”, “float32”, “float64”, “bfloat16”.

Methods

<code>build(input_d, rot_mat, natoms[, ...])</code>	Build the computational graph for fitting net.
<code>enable_mixed_precision([mixed_prec])</code>	Reveive the mixed precision setting.
<code>get_out_size()</code>	Get the output size.
<code>get_sel_type()</code>	Get selected atom types.
<code>init_variables(graph, graph_def[, suffix])</code>	Init the fitting net variables with the given dict.

build(input_d, rot_mat, natoms, input_dict: dict | None = None, reuse=None, suffix='') → Tensor
 Build the computational graph for fitting net.

Parameters

`input_d`
 The input descriptor

`rot_mat`
 The rotation matrix from the descriptor.

`natoms`
 The number of atoms. This tensor has the length of `Ntypes + 2` `natoms[0]`: number

of local atoms `natoms[1]`: total number of atoms held by this processor `natoms[i]`:
 $2 \leq i < Ntypes+2$, number of type i atoms

`input_dict`
 Additional dict for inputs.

`reuse`
 The weights in the networks should be reused when get the variable.

`suffix`
 Name suffix to identify this descriptor

Returns

polar
 The system polarizability

enable_mixed_precision(mixed_prec: dict | None = None) → None
 Reveal the mixed precision setting.

Parameters

`mixed_prec`
 The mixed precision setting used in the embedding net

get_out_size() → int
 Get the output size. Should be 9.

get_sel_type() → int
 Get selected atom types.

init_variables(graph: Graph, graph_def: GraphDef, suffix: str = '') → None
 Init the fitting net variables with the given dict.

Parameters

`graph`
 [tf.Graph] The input frozen model graph

`graph_def`
 [tf.GraphDef] The input frozen model graph_def

`suffix`
 [str] suffix to name scope

class deepmd.fit.polar.PolarFittingSeA(descript: Tensor, neuron: List[int] = [120, 120, 120],
 resnet_dt: bool = True, sel_type: List[int] | None = None,
 fit_diag: bool = True, scale: List[float] | None = None,
 shift_diag: bool = True, seed: int | None = None,
 activation_function: str = 'tanh', precision: str = 'default',
 uniform_seed: bool = False)

Bases: *Fitting*

Fit the atomic polarizability with descriptor `se_a`.

Parameters

`descript`
 [tf.Tensor] The descriptor

`neuron`
 [List[int]] Number of neurons in each hidden layer of the fitting net

resnet_dt
 [bool] Time-step dt in the resnet construction: $y = x + dt * \phi(Wx + b)$

sel_type
 [List[int]] The atom types selected to have an atomic polarizability prediction. If is None, all atoms are selected.

fit_diag
 [bool] Fit the diagonal part of the rotational invariant polarizability matrix, which will be converted to normal polarizability matrix by contracting with the rotation matrix.

scale
 [List[float]] The output of the fitting net (polarizability matrix) for type i atom will be scaled by scale[i]

diag_shift
 [List[float]] The diagonal part of the polarizability matrix of type i will be shifted by diag_shift[i]. The shift operation is carried out after scale.

seed
 [int] Random seed for initializing the network parameters.

activation_function
 [str] The activation function in the embedding net. Supported options are “relu”, “relu6”, “softplus”, “sigmoid”, “tanh”, “gelu”, “gelu_tf”, “None”, “none”.

precision
 [str] The precision of the embedding net parameters. Supported options are “default”, “float16”, “float32”, “float64”, “bfloat16”.

uniform_seed
 Only for the purpose of backward compatibility, retrieves the old behavior of using the random seed

Attributes

precision
 Precision of fitting network.

Methods

<i>build</i> (input_d, rot_mat, natoms[, ...])	Build the computational graph for fitting net.
<i>compute_input_stats</i> (all_stat[, protection])	Compute the input statistics.
<i>enable_mixed_precision</i> ([mixed_prec])	Reveive the mixed precision setting.
<i>get_out_size</i> ()	Get the output size.
<i>get_sel_type</i> ()	Get selected atom types.
<i>init_variables</i> (graph, graph_def[, suffix])	Init the fitting net variables with the given dict.

build(input_d: Tensor, rot_mat: Tensor, natoms: Tensor, input_dict: dict | None = None, reuse: bool | None = None, suffix: str = "")

Build the computational graph for fitting net.

Parameters

input_d
 The input descriptor

`rot_mat`
The rotation matrix from the descriptor.

`natoms`
The number of atoms. This tensor has the length of `Ntypes + 2` `natoms[0]`: number of local atoms `natoms[1]`: total number of atoms held by this processor `natoms[i]`: $2 \leq i < Ntypes+2$, number of type `i` atoms

`input_dict`
Additional dict for inputs.

`reuse`
The weights in the networks should be reused when get the variable.

`suffix`
Name suffix to identify this descriptor

Returns

`atomic_polar`
The atomic polarizability

`compute_input_stats`(`all_stat`, `protection=0.01`)

Compute the input statistics.

Parameters

`all_stat`
Dictionary of inputs. can be prepared by `model.make_stat_input`

`protection`
Divided-by-zero protection

`enable_mixed_precision`(`mixed_prec: dict | None = None`) \rightarrow `None`

Reveive the mixed precision setting.

Parameters

`mixed_prec`
The mixed precision setting used in the embedding net

`get_out_size`() \rightarrow `int`

Get the output size. Should be 9.

`get_sel_type`() \rightarrow `List[int]`

Get selected atom types.

`init_variables`(`graph: Graph`, `graph_def: GraphDef`, `suffix: str = ''`) \rightarrow `None`

Init the fitting net variables with the given dict.

Parameters

`graph`
[`tf.Graph`] The input frozen model graph

`graph_def`
[`tf.GraphDef`] The input frozen model graph_def

`suffix`
[`str`] suffix to name scope

deepmd.infer package

Submodule containing all the implemented potentials.

```
class deepmd.infer.DeepDipole(model_file: Path, load_prefix: str = 'load', default_tf_graph: bool =
                             False)
```

Bases: *DeepTensor*

Constructor.

Parameters

model_file
[Path] The name of the frozen model file.

load_prefix: str
The prefix in the load computational graph

default_tf_graph
[bool] If uses the default tf graph, otherwise build a new tf graph for evaluation

Warning: For developers: DeepTensor initializer must be called at the end after self.tensors are modified because it uses the data in self.tensors dict. Do not change the order!

Attributes

model_type
Get type of model.

model_version
Get version of model.

sess
Get TF session.

Methods

eval (coords, cells, atom_types[, atomic, ...])	Evaluate the model.
eval_full (coords, cells, atom_types[, ...])	Evaluate the model with interface similar to the energy model.
eval_typeebd ()	Evaluate output of type embedding network by using this model.
<i>get_dim_aparam</i> ()	Unsupported in this model.
<i>get_dim_fparam</i> ()	Unsupported in this model.
get_ntypes ()	Get the number of atom types of this model.
get_rcut ()	Get the cut-off radius of this model.
get_sel_type ()	Get the selected atom types of this model.
get_type_map ()	Get the type map (element name of the atom types) of this model.
make_natoms_vec (atom_types[, mixed_type])	Make the natom vector used by deepmd-kit.
reverse_map (vec, imap)	Reverse mapping of a vector according to the index map.
sort_input (coord, atom_type[, sel_atoms, ...])	Sort atoms in the system according their types.

`get_dim_aparam() → int`

Unsupported in this model.

`get_dim_fparam() → int`

Unsupported in this model.

`load_prefix: str`

`class deepmd.infer.DeepEval(model_file: Path, load_prefix: str = 'load', default_tf_graph: bool = False, auto_batch_size: bool | int | AutoBatchSize = False)`

Bases: `object`

Common methods for DeepPot, DeepWFC, DeepPolar, ...

Parameters

`model_file`

[`Path`] The name of the frozen model file.

`load_prefix: str`

The prefix in the load computational graph

`default_tf_graph`

[`bool`] If uses the default tf graph, otherwise build a new tf graph for evaluation

`auto_batch_size`

[`bool` or `int` or `AutomaticBatchSize`, default: `False`] If True, automatic batch size will be used. If int, it will be used as the initial batch size.

Attributes

`model_type`

Get type of model.

`model_version`

Get version of model.

`sess`

Get TF session.

Methods

<code>eval_typeebd()</code>	Evaluate output of type embedding network by using this model.
<code>make_natoms_vec(atom_types[, mixed_type])</code>	Make the natom vector used by deepmd-kit.
<code>reverse_map(vec, imap)</code>	Reverse mapping of a vector according to the index map.
<code>sort_input(coord, atom_type[, sel_atoms, ...])</code>	Sort atoms in the system according their types.

`eval_typeebd() → ndarray`

Evaluate output of type embedding network by using this model.

Returns

`np.ndarray`

The output of type embedding network. The shape is `[ntypes, o_size]`, where `ntypes` is the number of types, and `o_size` is the number of nodes in the output layer.

Raises

`KeyError`

If the model does not enable type embedding.

See also:

`deepmd.utils.type_embed.TypeEmbedNet`

The type embedding network.

Examples

Get the output of type embedding network of graph.pb:

```
>>> from deepmd.infer import DeepPotential
>>> dp = DeepPotential('graph.pb')
>>> dp.eval_typeembed()
```

load_prefix: `str`

make_natoms_vec(atom_types: `ndarray`, mixed_type: `bool` = `False`) → `ndarray`

Make the natom vector used by deepmd-kit.

Parameters

atom_types

The type of atoms

mixed_type

Whether to perform the mixed_type mode. If True, the input data has the mixed_type format (see doc/model/train_se_atten.md), in which frames in a system may have different natoms_vec(s), with the same nloc.

Returns

natoms

The number of atoms. This tensor has the length of Ntypes + 2 natoms[0]: number of local atoms natoms[1]: total number of atoms held by this processor natoms[i]: 2 ≤ i < Ntypes+2, number of type i atoms

property model_type: `str`

Get type of model.

:type:str

property model_version: `str`

Get version of model.

Returns

`str`

version of model

static reverse_map(vec: `ndarray`, imap: `List[int]`) → `ndarray`

Reverse mapping of a vector according to the index map.

Parameters

vec

Input vector. Be of shape [nframes, natoms, -1]

```

    imap
        Index map. Be of shape [natoms]

Returns
    vec_out
        Reverse mapped vector.

property sess: Session
    Get TF session.

static sort_input(coord: ndarray, atom_type: ndarray, sel_atoms: List[int] | None = None,
                    mixed_type: bool = False)
    Sort atoms in the system according to their types.

Parameters
    coord
        The coordinates of atoms. Should be of shape [nframes, natoms, 3]

    atom_type
        The type of atoms Should be of shape [natoms]

    sel_atoms
        The selected atoms by type

    mixed_type
        Whether to perform the mixed_type mode. If True, the input data has the
        mixed_type format (see doc/model/train_se_atten.md), in which frames in a sys-
        tem may have different natoms_vec(s), with the same nloc.

Returns
    coord_out
        The coordinates after sorting

    atom_type_out
        The atom types after sorting

    idx_map
        The index mapping from the input to the output. For example coord_out = co-
        ord[:,idx_map,:].

    sel_atom_type
        Only output if sel_atoms is not None The sorted selected atom types

    sel_idx_map
        Only output if sel_atoms is not None The index mapping from the selected atoms
        to sorted selected atoms.

class deepmd.infer.DeepGlobalPolar(model_file: str, load_prefix: str = 'load', default_tf_graph: bool
                                     = False)

Bases: DeepTensor

Constructor.

Parameters
    model_file
        [str] The name of the frozen model file.

    load_prefix: str
        The prefix in the load computational graph

```

`default_tf_graph`
 [bool] If uses the default tf graph, otherwise build a new tf graph for evaluation

Attributes

model_type
 Get type of model.

model_version
 Get version of model.

sess
 Get TF session.

Methods

<code>eval(coords, cells, atom_types[, atomic, ...])</code>	Evaluate the model.
<code>eval_full(coords, cells, atom_types[, ...])</code>	Evaluate the model with interface similar to the energy model.
<code>eval_typeebd()</code>	Evaluate output of type embedding network by using this model.
<code>get_dim_aparam()</code>	Unsupported in this model.
<code>get_dim_fparam()</code>	Unsupported in this model.
<code>get_ntypes()</code>	Get the number of atom types of this model.
<code>get_rcut()</code>	Get the cut-off radius of this model.
<code>get_sel_type()</code>	Get the selected atom types of this model.
<code>get_type_map()</code>	Get the type map (element name of the atom types) of this model.
<code>make_natoms_vec(atom_types[, mixed_type])</code>	Make the natom vector used by deepmd-kit.
<code>reverse_map(vec, imap)</code>	Reverse mapping of a vector according to the index map.
<code>sort_input(coord, atom_type[, sel_atoms, ...])</code>	Sort atoms in the system according their types.

eval (coords: `ndarray`, cells: `ndarray`, atom_types: `List[int]`, atomic: `bool` = False, fparam: `ndarray` | `None` = None, aparam: `ndarray` | `None` = None, efield: `ndarray` | `None` = None) → `ndarray`

Evaluate the model.

Parameters

coords
 The coordinates of atoms. The array should be of size nframes x natoms x 3

cells
 The cell of the region. If None then non-PBC is assumed, otherwise using PBC. The array should be of size nframes x 9

atom_types
 The atom types The list should contain natoms ints

atomic
 Not used in this model

fparam
 Not used in this model

aparam
 Not used in this model

`efield`
Not used in this model

Returns

tensor
The returned tensor If `atomic == False` then of size `nframes x variable_dof` else of size `nframes x natoms x variable_dof`

`get_dim_aparam()` → `int`
Unsupported in this model.

`get_dim_fparam()` → `int`
Unsupported in this model.

`load_prefix:` `str`

```
class deepmd.infer.DeepPolar(model_file: Path, load_prefix: str = 'load', default_tf_graph: bool =
                             False)
```

Bases: *DeepTensor*

Constructor.

Parameters

`model_file`
[`Path`] The name of the frozen model file.

`load_prefix:` `str`
The prefix in the load computational graph

`default_tf_graph`
[`bool`] If uses the default tf graph, otherwise build a new tf graph for evaluation

Warning: For developers: DeepTensor initializer must be called at the end after `self.tensors` are modified because it uses the data in `self.tensors` dict. Do not change the order!

Attributes

model_type
Get type of model.

model_version
Get version of model.

sess
Get TF session.

Methods

<code>eval(coords, cells, atom_types[, atomic, ...])</code>	Evaluate the model.
<code>eval_full(coords, cells, atom_types[, ...])</code>	Evaluate the model with interface similar to the energy model.
<code>eval_typeebd()</code>	Evaluate output of type embedding network by using this model.
<code>get_dim_aparam()</code>	Unsupported in this model.
<code>get_dim_fparam()</code>	Unsupported in this model.
<code>get_ntypes()</code>	Get the number of atom types of this model.
<code>get_rcut()</code>	Get the cut-off radius of this model.
<code>get_sel_type()</code>	Get the selected atom types of this model.
<code>get_type_map()</code>	Get the type map (element name of the atom types) of this model.
<code>make_natoms_vec(atom_types[, mixed_type])</code>	Make the natom vector used by deepmd-kit.
<code>reverse_map(vec, imap)</code>	Reverse mapping of a vector according to the index map.
<code>sort_input(coord, atom_type[, sel_atoms, ...])</code>	Sort atoms in the system according their types.

`get_dim_aparam()` → `int`

Unsupported in this model.

`get_dim_fparam()` → `int`

Unsupported in this model.

`load_prefix:` `str`

```
class deepmd.infer.DeepPot(model_file: Path, load_prefix: str = 'load', default_tf_graph: bool = False,
                           auto_batch_size: bool | int | AutoBatchSize = True)
```

Bases: *DeepEval*

Constructor.

Parameters

`model_file`

[`Path`] The name of the frozen model file.

`load_prefix:` `str`

The prefix in the load computational graph

`default_tf_graph`

[`bool`] If uses the default tf graph, otherwise build a new tf graph for evaluation

`auto_batch_size`

[`bool` or `int` or `AutomaticBatchSize`, default: `True`] If `True`, automatic batch size will be used. If `int`, it will be used as the initial batch size.

Warning: For developers: DeepTensor initializer must be called at the end after `self.tensors` are modified because it uses the data in `self.tensors` dict. Do not change the order!

Examples

```
>>> from deepmd.infer import DeepPot
>>> import numpy as np
>>> dp = DeepPot('graph.pb')
>>> coord = np.array([[1,0,0], [0,0,1.5], [1,0,3]]).reshape([1, -1])
>>> cell = np.diag(10 * np.ones(3)).reshape([1, -1])
>>> atype = [1,0,1]
>>> e, f, v = dp.eval(coord, cell, atype)
```

where e, f and v are predicted energy, force and virial of the system, respectively.

Attributes

model_type
Get type of model.

model_version
Get version of model.

sess
Get TF session.

Methods

<code>eval(coords, cells, atom_types[, atomic, ...])</code>	Evaluate the energy, force and virial by using this DP.
<code>eval_descriptor(coords, cells, atom_types[, ...])</code>	Evaluate descriptors by using this DP.
<code>eval_typeebd()</code>	Evaluate output of type embedding network by using this model.
<code>get_dim_aparam()</code>	Get the number (dimension) of atomic parameters of this DP.
<code>get_dim_fparam()</code>	Get the number (dimension) of frame parameters of this DP.
<code>get_ntypes()</code>	Get the number of atom types of this model.
<code>get_rcut()</code>	Get the cut-off radius of this model.
<code>get_sel_type()</code>	Unsupported in this model.
<code>get_type_map()</code>	Get the type map (element name of the atom types) of this model.
<code>make_natoms_vec(atom_types[, mixed_type])</code>	Make the natom vector used by deepmd-kit.
<code>reverse_map(vec, imap)</code>	Reverse mapping of a vector according to the index map.
<code>sort_input(coord, atom_type[, sel_atoms, ...])</code>	Sort atoms in the system according their types.

eval(coords: `ndarray`, cells: `ndarray`, atom_types: `List[int]`, atomic: `bool` = False, fparam: `ndarray` | `None` = None, aparam: `ndarray` | `None` = None, efield: `ndarray` | `None` = None, mixed_type: `bool` = False) → `Tuple[ndarray, ...]`

Evaluate the energy, force and virial by using this DP.

Parameters

coords
The coordinates of atoms. The array should be of size nframes x natoms x 3

cells
The cell of the region. If None then non-PBC is assumed, otherwise using PBC. The array should be of size nframes x 9

atom_types
The atom types The list should contain natoms ints

atomic
Calculate the atomic energy and virial

fparam
The frame parameter. The array can be of size : - nframes x dim_fparam. - dim_fparam. Then all frames are assumed to be provided with the same fparam.

aparam
The atomic parameter The array can be of size : - nframes x natoms x dim_aparam. - natoms x dim_aparam. Then all frames are assumed to be provided with the same aparam. - dim_aparam. Then all frames and atoms are provided with the same aparam.

efield
The external field on atoms. The array should be of size nframes x natoms x 3

mixed_type
Whether to perform the mixed_type mode. If True, the input data has the mixed_type format (see doc/model/train_se_atten.md), in which frames in a system may have different natoms_vec(s), with the same nloc.

Returns

energy
The system energy.

force
The force on each atom

virial
The virial

atom_energy
The atomic energy. Only returned when atomic == True

atom_virial
The atomic virial. Only returned when atomic == True

eval_descriptor(coords: `ndarray`, cells: `ndarray`, atom_types: `List[int]`, fparam: `ndarray` | `None` = `None`, aparam: `ndarray` | `None` = `None`, efield: `ndarray` | `None` = `None`, mixed_type: `bool` = `False`) → array

Evaluate descriptors by using this DP.

Parameters

coords
The coordinates of atoms. The array should be of size nframes x natoms x 3

cells
The cell of the region. If None then non-PBC is assumed, otherwise using PBC. The array should be of size nframes x 9

atom_types
The atom types The list should contain natoms ints

fparam
The frame parameter. The array can be of size : - nframes x dim_fparam. - dim_fparam. Then all frames are assumed to be provided with the same fparam.

aparam
The atomic parameter The array can be of size : - nframes x natoms x dim_aparam. - natoms x dim_aparam. Then all frames are assumed to be provided with the same aparam. - dim_aparam. Then all frames and atoms are provided with the same aparam.

efield
The external field on atoms. The array should be of size nframes x natoms x 3

mixed_type
Whether to perform the mixed_type mode. If True, the input data has the mixed_type format (see doc/model/train_se_atten.md), in which frames in a system may have different natoms_vec(s), with the same nloc.

Returns

descriptor
Descriptors.

get_dim_aparam() → int

Get the number (dimension) of atomic parameters of this DP.

get_dim_fparam() → int

Get the number (dimension) of frame parameters of this DP.

get_ntypes() → int

Get the number of atom types of this model.

get_rcut() → float

Get the cut-off radius of this model.

get_sel_type() → List[int]

Unsupported in this model.

get_type_map() → List[str]

Get the type map (element name of the atom types) of this model.

load_prefix: str

deepmd.infer.DeepPotential(model_file: str | Path, load_prefix: str = 'load', default_tf_graph: bool = False) → DeepDipole | DeepGlobalPolar | DeepPolar | DeepPot | DeepWFC

Factory function that will initialize appropriate potential read from model_file.

Parameters

model_file
[str] The name of the frozen model file.

load_prefix
[str] The prefix in the load computational graph

default_tf_graph
[bool] If uses the default tf graph, otherwise build a new tf graph for evaluation

Returns

Union[DeepDipole, DeepGlobalPolar, DeepPolar, DeepPot, DeepWFC]
one of the available potentials

Raises

RuntimeError

if model file does not correspond to any implemented potential

```
class deepmd.infer.DeepWFC(model_file: Path, load_prefix: str = 'load', default_tf_graph: bool = False)
```

Bases: *DeepTensor*

Constructor.

Parameters

model_file

[Path] The name of the frozen model file.

load_prefix: str

The prefix in the load computational graph

default_tf_graph

[bool] If uses the default tf graph, otherwise build a new tf graph for evaluation

Warning: For developers: DeepTensor initializer must be called at the end after self.tensors are modified because it uses the data in self.tensors dict. Do not change the order!

Attributes

model_type

Get type of model.

model_version

Get version of model.

sess

Get TF session.

Methods

<code>eval(coords, cells, atom_types[, atomic, ...])</code>	Evaluate the model.
<code>eval_full(coords, cells, atom_types[, ...])</code>	Evaluate the model with interface similar to the energy model.
<code>eval_typeebd()</code>	Evaluate output of type embedding network by using this model.
<code>get_dim_aparam()</code>	Unsupported in this model.
<code>get_dim_fparam()</code>	Unsupported in this model.
<code>get_ntypes()</code>	Get the number of atom types of this model.
<code>get_rcut()</code>	Get the cut-off radius of this model.
<code>get_sel_type()</code>	Get the selected atom types of this model.
<code>get_type_map()</code>	Get the type map (element name of the atom types) of this model.
<code>make_natoms_vec(atom_types[, mixed_type])</code>	Make the natom vector used by deepmd-kit.
<code>reverse_map(vec, imap)</code>	Reverse mapping of a vector according to the index map.
<code>sort_input(coord, atom_type[, sel_atoms, ...])</code>	Sort atoms in the system according their types.

```

get_dim_aparam() → int
    Unsupported in this model.

get_dim_fparam() → int
    Unsupported in this model.

load_prefix: str

class deepmd.infer.DipoleChargeModifier(model_name: str, model_charge_map: List[float],
                                         sys_charge_map: List[float], ewald_h: float = 1,
                                         ewald_beta: float = 1)

Bases: DeepDipole

Parameters
    model_name
        The model file for the DeepDipole model
    model_charge_map
        Gives the amount of charge for the wfcc
    sys_charge_map
        Gives the amount of charge for the real atoms
    ewald_h
        Grid spacing of the reciprocal part of Ewald sum. Unit: Å
    ewald_beta
        Splitting parameter of the Ewald sum. Unit: Å-1

Attributes
    model_type
        Get type of model.
    model_version
        Get version of model.
    sess
        Get TF session.

```

Methods

<code>build_fv_graph()</code>	Build the computational graph for the force and virial inference.
<code>eval(coord, box, atype[, eval_fv])</code>	Evaluate the modification.
<code>eval_full(coords, cells, atom_types[, ...])</code>	Evaluate the model with interface similar to the energy model.
<code>eval_typeebd()</code>	Evaluate output of type embedding network by using this model.
<code>get_dim_ainparam()</code>	Unsupported in this model.
<code>get_dim_fparam()</code>	Unsupported in this model.
<code>get_ntypes()</code>	Get the number of atom types of this model.
<code>get_rcut()</code>	Get the cut-off radius of this model.
<code>get_sel_type()</code>	Get the selected atom types of this model.
<code>get_type_map()</code>	Get the type map (element name of the atom types) of this model.
<code>make_natoms_vec(atom_types[, mixed_type])</code>	Make the natom vector used by deepmd-kit.
<code>modify_data(data)</code>	Modify data.
<code>reverse_map(vec, imap)</code>	Reverse mapping of a vector according to the index map.
<code>sort_input(coord, atom_type[, sel_atoms, ...])</code>	Sort atoms in the system according their types.

`build_fv_graph()` → Tensor

Build the computational graph for the force and virial inference.

`eval(coord: ndarray, box: ndarray, atype: ndarray, eval_fv: bool = True)` → Tuple[ndarray, ndarray, ndarray]

Evaluate the modification.

Parameters

`coord`
The coordinates of atoms

`box`
The simulation region. PBC is assumed

`atype`
The atom types

`eval_fv`
Evaluate force and virial

Returns

`tot_e`
The energy modification

`tot_f`
The force modification

`tot_v`
The virial modification

`load_prefix:` str

`modify_data(data: dict) → None`

Modify data.

Parameters

`data`

Internal data of DeepmdData. Be a dict, has the following keys - `coord` coordinates - `box` simulation box - `type` atom types - `find_energy` tells if data has energy - `find_force` tells if data has force - `find_virial` tells if data has virial - `energy` energy - `force` force - `virial` virial

`class deepmd.infer.EwaldRecp(hh, beta)`

Bases: `object`

Evaluate the reciprocal part of the Ewald sum.

Methods

<code>eval(coord, charge, box)</code>	Evaluate.
---------------------------------------	-----------

`eval(coord: ndarray, charge: ndarray, box: ndarray) → Tuple[ndarray, ndarray, ndarray]`

Evaluate.

Parameters

`coord`

The coordinates of atoms

`charge`

The atomic charge

`box`

The simulation region. PBC is assumed

Returns

`e`

The energy

`f`

The force

`v`

The virial

`deepmd.infer.calc_model_devi(coord, box, atype, models, fname=None, frequency=1)`

Python interface to calculate model deviation.

Parameters

`coord`

[`numpy.ndarray`, `n_frames` x `n_atoms` x 3] Coordinates of system to calculate

`box`

[`numpy.ndarray` or `None`, `n_frames` x 3 x 3] Box to specify periodic boundary condition. If `None`, no pbc will be used

`atype`

[`numpy.ndarray`, `n_atoms` x 1] Atom types

models
 [list of *DeepPot* models] Models used to evaluate deviation

fname
 [str or None] File to dump results, default None

frequency
 [int] Steps between frames (if the system is given by molecular dynamics engine),
 default 1

Returns

model_devi
 [numpy.ndarray, n_frames x 7] Model deviation results. The first column is index of
 steps, the other 6 columns are max_devi_v, min_devi_v, avg_devi_v, max_devi_f,
 min_devi_f, avg_devi_f.

Examples

```
>>> from deepmd.infer import calc_model_devi
>>> from deepmd.infer import DeepPot as DP
>>> import numpy as np
>>> coord = np.array([[1,0,0], [0,0,1.5], [1,0,3]]).reshape([1, -1])
>>> cell = np.diag(10 * np.ones(3)).reshape([1, -1])
>>> atype = [1,0,1]
>>> graphs = [DP("graph.000.pb"), DP("graph.001.pb")]
>>> model_devi = calc_model_devi(coord, cell, atype, graphs)
```

Submodules

deepmd.infer.data_modifier module

```
class deepmd.infer.data_modifier.DipoleChargeModifier(model_name: str, model_charge_map:
                                                         List[float], sys_charge_map: List[float],
                                                         ewald_h: float = 1, ewald_beta: float = 1)
```

Bases: *DeepDipole*

Parameters

model_name
 The model file for the DeepDipole model

model_charge_map
 Gives the amount of charge for the wfcc

sys_charge_map
 Gives the amount of charge for the real atoms

ewald_h
 Grid spacing of the reciprocal part of Ewald sum. Unit: Å

ewald_beta
 Splitting parameter of the Ewald sum. Unit: Å⁻¹

Attributes

model_type
Get type of model.

model_version
Get version of model.

sess
Get TF session.

Methods

<i>build_fv_graph()</i>	Build the computational graph for the force and virial inference.
<i>eval</i> (coord, box, atype[, eval_fv])	Evaluate the modification.
<i>eval_full</i> (coords, cells, atom_types[, ...])	Evaluate the model with interface similar to the energy model.
<i>eval_typeebd</i> ()	Evaluate output of type embedding network by using this model.
<i>get_dim_aparam</i> ()	Unsupported in this model.
<i>get_dim_fparam</i> ()	Unsupported in this model.
<i>get_ntypes</i> ()	Get the number of atom types of this model.
<i>get_rcut</i> ()	Get the cut-off radius of this model.
<i>get_sel_type</i> ()	Get the selected atom types of this model.
<i>get_type_map</i> ()	Get the type map (element name of the atom types) of this model.
<i>make_natoms_vec</i> (atom_types[, mixed_type])	Make the natom vector used by deepmd-kit.
<i>modify_data</i> (data)	Modify data.
<i>reverse_map</i> (vec, imap)	Reverse mapping of a vector according to the index map.
<i>sort_input</i> (coord, atom_type[, sel_atoms, ...])	Sort atoms in the system according their types.

build_fv_graph() → Tensor

Build the computational graph for the force and virial inference.

eval(coord: ndarray, box: ndarray, atype: ndarray, eval_fv: bool = True) → Tuple[ndarray, ndarray, ndarray]

Evaluate the modification.

Parameters

coord
The coordinates of atoms

box
The simulation region. PBC is assumed

atype
The atom types

eval_fv
Evaluate force and virial

Returns

tot_e
The energy modification

tot_f
The force modification

tot_v
The virial modification

load_prefix: *str*

modify_data(data: *dict*) → *None*
Modify data.

Parameters

data
Internal data of DeepmdData. Be a dict, has the following keys - coord coordinates - box simulation box - type atom types - find_energy tells if data has energy - find_force tells if data has force - find_virial tells if data has virial - energy energy - force force - virial virial

deepmd.infer.deep_dipole module

class deepmd.infer.deep_dipole.DeepDipole(model_file: *Path*, load_prefix: *str* = 'load', default_tf_graph: *bool* = False)

Bases: *DeepTensor*

Constructor.

Parameters

model_file
[*Path*] The name of the frozen model file.

load_prefix: *str*
The prefix in the load computational graph

default_tf_graph
[*bool*] If uses the default tf graph, otherwise build a new tf graph for evaluation

Warning: For developers: DeepTensor initializer must be called at the end after self.tensors are modified because it uses the data in self.tensors dict. Do not chanage the order!

Attributes

model_type
Get type of model.

model_version
Get version of model.

sess
Get TF session.

Methods

<code>eval(coords, cells, atom_types[, atomic, ...])</code>	Evaluate the model.
<code>eval_full(coords, cells, atom_types[, ...])</code>	Evaluate the model with interface similar to the energy model.
<code>eval_typeebd()</code>	Evaluate output of type embedding network by using this model.
<code>get_dim_aparam()</code>	Unsupported in this model.
<code>get_dim_fparam()</code>	Unsupported in this model.
<code>get_ntypes()</code>	Get the number of atom types of this model.
<code>get_rcut()</code>	Get the cut-off radius of this model.
<code>get_sel_type()</code>	Get the selected atom types of this model.
<code>get_type_map()</code>	Get the type map (element name of the atom types) of this model.
<code>make_natoms_vec(atom_types[, mixed_type])</code>	Make the natom vector used by deepmd-kit.
<code>reverse_map(vec, imap)</code>	Reverse mapping of a vector according to the index map.
<code>sort_input(coord, atom_type[, sel_atoms, ...])</code>	Sort atoms in the system according their types.

`get_dim_aparam() → int`

Unsupported in this model.

`get_dim_fparam() → int`

Unsupported in this model.

`load_prefix: str`

deepmd.infer.deep_eval module

```
class deepmd.infer.deep_eval.DeepEval(model_file: Path, load_prefix: str = 'load', default_tf_graph:
    bool = False, auto_batch_size: bool | int | AutomaticBatchSize =
    False)
```

Bases: `object`

Common methods for DeepPot, DeepWFC, DeepPolar, ...

Parameters

`model_file`

[`Path`] The name of the frozen model file.

`load_prefix: str`

The prefix in the load computational graph

`default_tf_graph`

[`bool`] If uses the default tf graph, otherwise build a new tf graph for evaluation

`auto_batch_size`

[`bool` or `int` or `AutomaticBatchSize`, default: `False`] If True, automatic batch size will be used. If int, it will be used as the initial batch size.

Attributes

`model_type`

Get type of model.

`model_version`
Get version of model.

`sess`
Get TF session.

Methods

<code>eval_typeebd()</code>	Evaluate output of type embedding network by using this model.
<code>make_natoms_vec(atom_types[, mixed_type])</code>	Make the natom vector used by deepmd-kit.
<code>reverse_map(vec, imap)</code>	Reverse mapping of a vector according to the index map.
<code>sort_input(coord, atom_type[, sel_atoms, ...])</code>	Sort atoms in the system according their types.

`eval_typeebd()` → `ndarray`

Evaluate output of type embedding network by using this model.

Returns

`np.ndarray`

The output of type embedding network. The shape is `[ntypes, o_size]`, where `ntypes` is the number of types, and `o_size` is the number of nodes in the output layer.

Raises

`KeyError`

If the model does not enable type embedding.

See also:

`deepmd.utils.type_embed.TypeEmbedNet`

The type embedding network.

Examples

Get the output of type embedding network of graph.pb:

```
>>> from deepmd.infer import DeepPotential
>>> dp = DeepPotential('graph.pb')
>>> dp.eval_typeebd()
```

`load_prefix:` `str`

`make_natoms_vec(atom_types: ndarray, mixed_type: bool = False)` → `ndarray`

Make the natom vector used by deepmd-kit.

Parameters

`atom_types`

The type of atoms

`mixed_type`

Whether to perform the `mixed_type` mode. If True, the input data has the `mixed_type` format (see doc/model/train_se_atten.md), in which frames in a system may have different natoms_vec(s), with the same nloc.

Returns

natoms

The number of atoms. This tensor has the length of $N_{\text{types}} + 2$. `natoms[0]`: number of local atoms `natoms[1]`: total number of atoms held by this processor `natoms[i]`: $2 \leq i < N_{\text{types}} + 2$, number of type i atoms

property model_type: `str`

Get type of model.

:type: `str`

property model_version: `str`

Get version of model.

Returns

`str`

version of model

static reverse_map(`vec: ndarray`, `imap: List[int]`) \rightarrow `ndarray`

Reverse mapping of a vector according to the index map.

Parameters

`vec`

Input vector. Be of shape `[nframes, natoms, -1]`

`imap`

Index map. Be of shape `[natoms]`

Returns

vec_out

Reverse mapped vector.

property sess: `Session`

Get TF session.

static sort_input(`coord: ndarray`, `atom_type: ndarray`, `sel_atoms: List[int] | None = None`, `mixed_type: bool = False`)

Sort atoms in the system according their types.

Parameters

`coord`

The coordinates of atoms. Should be of shape `[nframes, natoms, 3]`

`atom_type`

The type of atoms Should be of shape `[natoms]`

`sel_atoms`

The selected atoms by type

`mixed_type`

Whether to perform the `mixed_type` mode. If `True`, the input data has the `mixed_type` format (see `doc/model/train_se_atten.md`), in which frames in a system may have different `natoms_vec(s)`, with the same `nloc`.

Returns

coord_out

The coordinates after sorting

atom_type_out
The atom types after sorting

idx_map
The index mapping from the input to the output. For example `coord_out = coord[:,idx_map,:]`

sel_atom_type
Only output if `sel_atoms` is not None The sorted selected atom types

sel_idx_map
Only output if `sel_atoms` is not None The index mapping from the selected atoms to sorted selected atoms.

deepmd.infer.deep_polar module

```
class deepmd.infer.deep_polar.DeepGlobalPolar(model_file: str, load_prefix: str = 'load',
                                              default_tf_graph: bool = False)
```

Bases: *DeepTensor*

Constructor.

Parameters

model_file
[*str*] The name of the frozen model file.

load_prefix: *str*
The prefix in the load computational graph

default_tf_graph
[*bool*] If uses the default tf graph, otherwise build a new tf graph for evaluation

Attributes

model_type
Get type of model.

model_version
Get version of model.

sess
Get TF session.

Methods

<code>eval(coords, cells, atom_types[, atomic, ...])</code>	Evaluate the model.
<code>eval_full(coords, cells, atom_types[, ...])</code>	Evaluate the model with interface similar to the energy model.
<code>eval_typeebd()</code>	Evaluate output of type embedding network by using this model.
<code>get_dim_aparam()</code>	Unsupported in this model.
<code>get_dim_fparam()</code>	Unsupported in this model.
<code>get_ntypes()</code>	Get the number of atom types of this model.
<code>get_rcut()</code>	Get the cut-off radius of this model.
<code>get_sel_type()</code>	Get the selected atom types of this model.
<code>get_type_map()</code>	Get the type map (element name of the atom types) of this model.
<code>make_natoms_vec(atom_types[, mixed_type])</code>	Make the natom vector used by deepmd-kit.
<code>reverse_map(vec, imap)</code>	Reverse mapping of a vector according to the index map.
<code>sort_input(coord, atom_type[, sel_atoms, ...])</code>	Sort atoms in the system according their types.

eval (coords: `ndarray`, cells: `ndarray`, atom_types: `List[int]`, atomic: `bool` = False, fparam: `ndarray` | `None` = None, aparam: `ndarray` | `None` = None, efield: `ndarray` | `None` = None) → `ndarray`

Evaluate the model.

Parameters

`coords`

The coordinates of atoms. The array should be of size nframes x natoms x 3

`cells`

The cell of the region. If None then non-PBC is assumed, otherwise using PBC. The array should be of size nframes x 9

`atom_types`

The atom types The list should contain natoms ints

`atomic`

Not used in this model

`fparam`

Not used in this model

`aparam`

Not used in this model

`efield`

Not used in this model

Returns

tensor

The returned tensor If atomic == False then of size nframes x variable_dof else of size nframes x natoms x variable_dof

get_dim_aparam() → `int`

Unsupported in this model.

`get_dim_fparam() → int`

Unsupported in this model.

`load_prefix: str`

```
class deepmd.infer.deep_polar.DeepPolar(model_file: Path, load_prefix: str = 'load',
                                         default_tf_graph: bool = False)
```

Bases: *DeepTensor*

Constructor.

Parameters

`model_file`

[Path] The name of the frozen model file.

`load_prefix: str`

The prefix in the load computational graph

`default_tf_graph`

[bool] If uses the default tf graph, otherwise build a new tf graph for evaluation

Warning: For developers: DeepTensor initializer must be called at the end after self.tensors are modified because it uses the data in self.tensors dict. Do not change the order!

Attributes

model_type

Get type of model.

model_version

Get version of model.

sess

Get TF session.

Methods

<code>eval(coords, cells, atom_types[, atomic, ...])</code>	Evaluate the model.
<code>eval_full(coords, cells, atom_types[, ...])</code>	Evaluate the model with interface similar to the energy model.
<code>eval_typeebd()</code>	Evaluate output of type embedding network by using this model.
<code>get_dim_aparam()</code>	Unsupported in this model.
<code>get_dim_fparam()</code>	Unsupported in this model.
<code>get_ntypes()</code>	Get the number of atom types of this model.
<code>get_rcut()</code>	Get the cut-off radius of this model.
<code>get_sel_type()</code>	Get the selected atom types of this model.
<code>get_type_map()</code>	Get the type map (element name of the atom types) of this model.
<code>make_natoms_vec(atom_types[, mixed_type])</code>	Make the natom vector used by deepmd-kit.
<code>reverse_map(vec, imap)</code>	Reverse mapping of a vector according to the index map.
<code>sort_input(coord, atom_type[, sel_atoms, ...])</code>	Sort atoms in the system according their types.

```

get_dim_aparam() → int
    Unsupported in this model.

get_dim_fparam() → int
    Unsupported in this model.

load_prefix: str

```

deepmd.infer.deep_pot module

```

class deepmd.infer.deep_pot.DeepPot(model_file: Path, load_prefix: str = 'load', default_tf_graph:
    bool = False, auto_batch_size: bool | int | AutoBatchSize =
    True)

```

Bases: *DeepEval*

Constructor.

Parameters

```

model_file
    [Path] The name of the frozen model file.

load_prefix: str
    The prefix in the load computational graph

default_tf_graph
    [bool] If uses the default tf graph, otherwise build a new tf graph for evaluation

auto_batch_size
    [bool or int or AutomaticBatchSize, default: True] If True, automatic batch size
    will be used. If int, it will be used as the initial batch size.

```

Warning: For developers: DeepTensor initializer must be called at the end after self.tensors are modified because it uses the data in self.tensors dict. Do not change the order!

Examples

```

>>> from deepmd.infer import DeepPot
>>> import numpy as np
>>> dp = DeepPot('graph.pb')
>>> coord = np.array([[1,0,0], [0,0,1.5], [1,0,3]]).reshape([1, -1])
>>> cell = np.diag(10 * np.ones(3)).reshape([1, -1])
>>> atype = [1,0,1]
>>> e, f, v = dp.eval(coord, cell, atype)

```

where e, f and v are predicted energy, force and virial of the system, respectively.

Attributes

```

model_type
    Get type of model.

model_version
    Get version of model.

```

sess

Get TF session.

Methods

<code>eval(coords, cells, atom_types[, atomic, ...])</code>	Evaluate the energy, force and virial by using this DP.
<code>eval_descriptor(coords, cells, atom_types[, ...])</code>	Evaluate descriptors by using this DP.
<code>eval_typeebd()</code>	Evaluate output of type embedding network by using this model.
<code>get_dim_aparam()</code>	Get the number (dimension) of atomic parameters of this DP.
<code>get_dim_fparam()</code>	Get the number (dimension) of frame parameters of this DP.
<code>get_ntypes()</code>	Get the number of atom types of this model.
<code>get_rcut()</code>	Get the cut-off radius of this model.
<code>get_sel_type()</code>	Unsupported in this model.
<code>get_type_map()</code>	Get the type map (element name of the atom types) of this model.
<code>make_natoms_vec(atom_types[, mixed_type])</code>	Make the natom vector used by deepmd-kit.
<code>reverse_map(vec, imap)</code>	Reverse mapping of a vector according to the index map.
<code>sort_input(coord, atom_type[, sel_atoms, ...])</code>	Sort atoms in the system according their types.

eval (coords: `ndarray`, cells: `ndarray`, atom_types: `List[int]`, atomic: `bool` = False, fparam: `ndarray` | `None` = None, aparam: `ndarray` | `None` = None, efield: `ndarray` | `None` = None, mixed_type: `bool` = False) → `Tuple[ndarray, ...]`

Evaluate the energy, force and virial by using this DP.

Parameters

coords

The coordinates of atoms. The array should be of size nframes x natoms x 3

cells

The cell of the region. If None then non-PBC is assumed, otherwise using PBC. The array should be of size nframes x 9

atom_types

The atom types The list should contain natoms ints

atomic

Calculate the atomic energy and virial

fparam

The frame parameter. The array can be of size : - nframes x dim_fparam. - dim_fparam. Then all frames are assumed to be provided with the same fparam.

aparam

The atomic parameter The array can be of size : - nframes x natoms x dim_aparam. - natoms x dim_aparam. Then all frames are assumed to be provided with the same aparam. - dim_aparam. Then all frames and atoms are provided with the same aparam.

efield

The external field on atoms. The array should be of size nframes x natoms x 3

mixed_type

Whether to perform the mixed_type mode. If True, the input data has the mixed_type format (see doc/model/train_se_atten.md), in which frames in a system may have different natoms_vec(s), with the same nloc.

Returns

energy

The system energy.

force

The force on each atom

virial

The virial

atom_energy

The atomic energy. Only returned when atomic == True

atom_virial

The atomic virial. Only returned when atomic == True

eval_descriptor(coords: ndarray, cells: ndarray, atom_types: List[int], fparam: ndarray | None = None, aparam: ndarray | None = None, efield: ndarray | None = None, mixed_type: bool = False) → array

Evaluate descriptors by using this DP.

Parameters

coords

The coordinates of atoms. The array should be of size nframes x natoms x 3

cells

The cell of the region. If None then non-PBC is assumed, otherwise using PBC. The array should be of size nframes x 9

atom_types

The atom types The list should contain natoms ints

fparam

The frame parameter. The array can be of size : - nframes x dim_fparam. - dim_fparam. Then all frames are assumed to be provided with the same fparam.

aparam

The atomic parameter The array can be of size : - nframes x natoms x dim_aparam. - natoms x dim_aparam. Then all frames are assumed to be provided with the same aparam. - dim_aparam. Then all frames and atoms are provided with the same aparam.

efield

The external field on atoms. The array should be of size nframes x natoms x 3

mixed_type

Whether to perform the mixed_type mode. If True, the input data has the mixed_type format (see doc/model/train_se_atten.md), in which frames in a system may have different natoms_vec(s), with the same nloc.

Returns

descriptor
Descriptors.

get_dim_aparam() → `int`
Get the number (dimension) of atomic parameters of this DP.

get_dim_fparam() → `int`
Get the number (dimension) of frame parameters of this DP.

get_ntypes() → `int`
Get the number of atom types of this model.

get_rcut() → `float`
Get the cut-off radius of this model.

get_sel_type() → `List[int]`
Unsupported in this model.

get_type_map() → `List[str]`
Get the type map (element name of the atom types) of this model.

load_prefix: `str`

deepmd.infer.deep_tensor module

```
class deepmd.infer.deep_tensor.DeepTensor(model_file: Path, load_prefix: str = 'load',
                                           default_tf_graph: bool = False)
```

Bases: *DeepEval*

Evaluates a tensor model.

Parameters

model_file: `str`
The name of the frozen model file.

load_prefix: `str`
The prefix in the load computational graph

default_tf_graph
[`bool`] If uses the default tf graph, otherwise build a new tf graph for evaluation

Attributes

model_type
Get type of model.

model_version
Get version of model.

sess
Get TF session.

Methods

<code>eval(coords, cells, atom_types[, atomic, ...])</code>	Evaluate the model.
<code>eval_full(coords, cells, atom_types[, ...])</code>	Evaluate the model with interface similar to the energy model.
<code>eval_typeebd()</code>	Evaluate output of type embedding network by using this model.
<code>get_dim_aparam()</code>	Get the number (dimension) of atomic parameters of this DP.
<code>get_dim_fparam()</code>	Get the number (dimension) of frame parameters of this DP.
<code>get_ntypes()</code>	Get the number of atom types of this model.
<code>get_rcut()</code>	Get the cut-off radius of this model.
<code>get_sel_type()</code>	Get the selected atom types of this model.
<code>get_type_map()</code>	Get the type map (element name of the atom types) of this model.
<code>make_natoms_vec(atom_types[, mixed_type])</code>	Make the natom vector used by deepmd-kit.
<code>reverse_map(vec, imap)</code>	Reverse mapping of a vector according to the index map.
<code>sort_input(coord, atom_type[, sel_atoms, ...])</code>	Sort atoms in the system according their types.

eval (coords: `ndarray`, cells: `ndarray`, atom_types: `List[int]`, atomic: `bool` = True, fparam: `ndarray` | `None` = None, aparam: `ndarray` | `None` = None, efield: `ndarray` | `None` = None, mixed_type: `bool` = False) → `ndarray`

Evaluate the model.

Parameters

coords

The coordinates of atoms. The array should be of size nframes x natoms x 3

cells

The cell of the region. If None then non-PBC is assumed, otherwise using PBC. The array should be of size nframes x 9

atom_types

The atom types The list should contain natoms ints

atomic

If True (default), return the atomic tensor Otherwise return the global tensor

fparam

Not used in this model

aparam

Not used in this model

efield

Not used in this model

mixed_type

Whether to perform the mixed_type mode. If True, the input data has the mixed_type format (see doc/model/train_se_atten.md), in which frames in a system may have different natoms_vec(s), with the same nloc.

Returns

tensor

The returned tensor If `atomic == False` then of size `nframes x output_dim` else of size `nframes x natoms x output_dim`

`eval_full`(coords: `ndarray`, cells: `ndarray`, atom_types: `List[int]`, atomic: `bool` = `False`, fparam: `array` | `None` = `None`, aparam: `array` | `None` = `None`, efield: `array` | `None` = `None`, mixed_type: `bool` = `False`) → `Tuple[ndarray, ...]`

Evaluate the model with interface similar to the energy model. Will return global tensor, component-wise force and virial and optionally atomic tensor and atomic virial.

Parameters

coords

The coordinates of atoms. The array should be of size `nframes x natoms x 3`

cells

The cell of the region. If `None` then non-PBC is assumed, otherwise using PBC. The array should be of size `nframes x 9`

atom_types

The atom types The list should contain `natoms` ints

atomic

Whether to calculate atomic tensor and virial

fparam

Not used in this model

aparam

Not used in this model

efield

Not used in this model

mixed_type

Whether to perform the `mixed_type` mode. If `True`, the input data has the `mixed_type` format (see `doc/model/train_se_atten.md`), in which frames in a system may have different `natoms_vec(s)`, with the same `nloc`.

Returns

tensor

The global tensor. shape: `[nframes x nout]`

force

The component-wise force (negative derivative) on each atom. shape: `[nframes x nout x natoms x 3]`

virial

The component-wise virial of the tensor. shape: `[nframes x nout x 9]`

atom_tensor

The atomic tensor. Only returned when `atomic == True` shape: `[nframes x natoms x nout]`

atom_virial

The atomic virial. Only returned when `atomic == True` shape: `[nframes x nout x natoms x 9]`

`get_dim_aparam()` → `int`

Get the number (dimension) of atomic parameters of this DP.

```

get_dim_fparam() → int
    Get the number (dimension) of frame parameters of this DP.

get_ntypes() → int
    Get the number of atom types of this model.

get_rcut() → float
    Get the cut-off radius of this model.

get_sel_type() → List[int]
    Get the selected atom types of this model.

get_type_map() → List[str]
    Get the type map (element name of the atom types) of this model.

load_prefix: str

tensors = {'t_box': 't_box:0', 't_coord': 't_coord:0', 't_mesh': 't_mesh:0',
't_natoms': 't_natoms:0', 't_ntypes': 'descript_attr/ntypes:0', 't_output_dim':
'model_attr/output_dim:0', 't_rcut': 'descript_attr/rcut:0', 't_sel_type':
'model_attr/sel_type:0', 't_tmap': 'model_attr/tmap:0', 't_type': 't_type:0'}

```

deepmd.infer.deep_wfc module

```

class deepmd.infer.deep_wfc.DeepWFC(model_file: Path, load_prefix: str = 'load', default_tf_graph:
    bool = False)

```

Bases: *DeepTensor*

Constructor.

Parameters

model_file
[Path] The name of the frozen model file.

load_prefix: str
The prefix in the load computational graph

default_tf_graph
[bool] If uses the default tf graph, otherwise build a new tf graph for evaluation

Warning: For developers: DeepTensor initializer must be called at the end after self.tensors are modified because it uses the data in self.tensors dict. Do not change the order!

Attributes

model_type
Get type of model.

model_version
Get version of model.

sess
Get TF session.

Methods

<code>eval(coords, cells, atom_types[, atomic, ...])</code>	Evaluate the model.
<code>eval_full(coords, cells, atom_types[, ...])</code>	Evaluate the model with interface similar to the energy model.
<code>eval_typeebd()</code>	Evaluate output of type embedding network by using this model.
<code>get_dim_aparam()</code>	Unsupported in this model.
<code>get_dim_fparam()</code>	Unsupported in this model.
<code>get_ntypes()</code>	Get the number of atom types of this model.
<code>get_rcut()</code>	Get the cut-off radius of this model.
<code>get_sel_type()</code>	Get the selected atom types of this model.
<code>get_type_map()</code>	Get the type map (element name of the atom types) of this model.
<code>make_natoms_vec(atom_types[, mixed_type])</code>	Make the natom vector used by deepmd-kit.
<code>reverse_map(vec, imap)</code>	Reverse mapping of a vector according to the index map.
<code>sort_input(coord, atom_type[, sel_atoms, ...])</code>	Sort atoms in the system according their types.

`get_dim_aparam() → int`

Unsupported in this model.

`get_dim_fparam() → int`

Unsupported in this model.

`load_prefix: str`

deepmd.infer.ewald_rec module

`class deepmd.infer.ewald_rec.EwaldRecp(hh, beta)`

Bases: `object`

Evaluate the reciprocal part of the Ewald sum.

Methods

<code>eval(coord, charge, box)</code>	Evaluate.
---------------------------------------	-----------

`eval(coord: ndarray, charge: ndarray, box: ndarray) → Tuple[ndarray, ndarray, ndarray]`

Evaluate.

Parameters

`coord`

The coordinates of atoms

`charge`

The atomic charge

`box`

The simulation region. PBC is assumed

Returns

e
The energy

f
The force

v
The virial

deepmd.infer.model_devi module

`deepmd.infer.model_devi.calc_model_devi(coord, box, atype, models, fname=None, frequency=1)`

Python interface to calculate model deviation.

Parameters

coord
[`numpy.ndarray`, n_frames x n_atoms x 3] Coordinates of system to calculate

box
[`numpy.ndarray` or `None`, n_frames x 3 x 3] Box to specify periodic boundary condition. If `None`, no pbc will be used

atype
[`numpy.ndarray`, n_atoms x 1] Atom types

models
[list of DeepPot models] Models used to evaluate deviation

fname
[`str` or `None`] File to dump results, default `None`

frequency
[`int`] Steps between frames (if the system is given by molecular dynamics engine), default 1

Returns

model_devi
[`numpy.ndarray`, n_frames x 7] Model deviation results. The first column is index of steps, the other 6 columns are `max_devi_v`, `min_devi_v`, `avg_devi_v`, `max_devi_f`, `min_devi_f`, `avg_devi_f`.

Examples

```
>>> from deepmd.infer import calc_model_devi
>>> from deepmd.infer import DeepPot as DP
>>> import numpy as np
>>> coord = np.array([[1,0,0], [0,0,1.5], [1,0,3]]).reshape([1, -1])
>>> cell = np.diag(10 * np.ones(3)).reshape([1, -1])
>>> atype = [1,0,1]
>>> graphs = [DP("graph.000.pb"), DP("graph.001.pb")]
>>> model_devi = calc_model_devi(coord, cell, atype, graphs)
```

```
deepmd.infer.model_devi.calc_model_devi_e(es: ndarray)
```

Parameters

es
[numpy.ndarray] size of n_models x n_frames x n_atoms

```
deepmd.infer.model_devi.calc_model_devi_f(fs: ndarray)
```

Parameters

fs
[numpy.ndarray] size of n_models x n_frames x n_atoms x 3

```
deepmd.infer.model_devi.calc_model_devi_v(vs: ndarray)
```

Parameters

vs
[numpy.ndarray] size of n_models x n_frames x 9

```
deepmd.infer.model_devi.make_model_devi(*, models: list, system: str, set_prefix: str, output: str,  
                                         frequency: int, **kwargs)
```

Make model deviation calculation.

Parameters

models
[list] A list of paths of models to use for making model deviation

system
[str] The path of system to make model deviation calculation

set_prefix
[str] The set prefix of the system

output
[str] The output file for model deviation results

frequency
[int] The number of steps that elapse between writing coordinates in a trajectory by a MD engine (such as Gromacs / Lammps). This paramter is used to determine the index in the output file.

**kwargs
Arbitrary keyword arguments.

```
deepmd.infer.model_devi.write_model_devi_out(devi: ndarray, fname: str, header: str = "")
```

Parameters

devi
[numpy.ndarray] the first column is the steps index

fname
[str] the file name to dump

header
[str, default=""] the header to dump

deepmd.loggers package

Module taking care of logging duties.

`deepmd.loggers.set_log_handles`(level: `int`, log_path: `Path` | `None` = `None`, mpi_log: `str` | `None` = `None`)

Set desired level for package loggers and add file handlers.

Parameters

level

[`int`] logging level

log_path

[`Optional`[`str`]] path to log file, if `None` logs will be send only to console. If the parent directory does not exist it will be automatically created, by default `None`

mpi_log

[`Optional`[`str`], `optional`] mpi log type. Has three options. master will output logs to file and console only from rank==0. collect will write messages from all ranks to one file opened under rank==0 and to console. workers will open one log file for each worker designated by its rank, console behaviour is the same as for collect. If this argument is specified, package 'mpi4py' must be already installed. by default `None`

Raises

`RuntimeError`

If the argument `mpi_log` is specified, package `mpi4py` is not installed.

Notes

Logging levels:

	our notation	python logging	tensorflow cpp	OpenMP
debug	10	10	0	1/on/true/yes
info	20	20	1	0/off/false/no
warning	30	30	2	0/off/false/no
error	40	40	3	0/off/false/no

Submodules

deepmd.loggers.loggers module

Logger initialization for package.

`deepmd.loggers.loggers.set_log_handles`(level: `int`, log_path: `Path` | `None` = `None`, mpi_log: `str` | `None` = `None`)

Set desired level for package loggers and add file handlers.

Parameters

level

[`int`] logging level

log_path

[`Optional[str]`] path to log file, if `None` logs will be send only to console. If the parent directory does not exist it will be automatically created, by default `None`

mpi_log

[`Optional[str]`, `optional`] mpi log type. Has three options. master will output logs to file and console only from rank==0. collect will write messages from all ranks to one file opened under rank==0 and to console. workers will open one log file for each worker designated by its rank, console behaviour is the same as for collect. If this argument is specified, package 'mpi4py' must be already installed. by default `None`

Raises

`RuntimeError`

If the argument `mpi_log` is specified, package `mpi4py` is not installed.

Notes

Logging levels:

	our notation	python logging	tensorflow cpp	OpenMP
debug	10	10	0	1/on/true/yes
info	20	20	1	0/off/false/no
warning	30	30	2	0/off/false/no

deepmd.loss package

```
class deepmd.loss.EnerDipoleLoss(starter_learning_rate: float, start_pref_e: float = 0.1, limit_pref_e:
                                float = 1.0, start_pref_ed: float = 1.0, limit_pref_ed: float = 1.0)
```

Bases: *Loss*

Methods

<i>build</i> (learning_rate, natoms, model_dict, ...)	Build the loss function graph.
<i>eval</i> (sess, feed_dict, natoms)	Eval the loss function.

```
build(learning_rate, natoms, model_dict, label_dict, suffix)
```

Build the loss function graph.

Parameters

learning_rate
[*tf.Tensor*] learning rate

natoms
[*tf.Tensor*] number of atoms

model_dict
[*dict*[*str*, *tf.Tensor*]] A dictionary that maps model keys to tensors

label_dict
[*dict*[*str*, *tf.Tensor*]] A dictionary that maps label keys to tensors

suffix
[*str*] suffix

Returns

tf.Tensor
the total squared loss

dict[*str*, *tf.Tensor*]
A dictionary that maps loss keys to more loss tensors

```
eval(sess, feed_dict, natoms)
```

Eval the loss function.

Parameters

sess
[*tf.Session*] TensorFlow session

feed_dict
[*dict*[*tf.placeholder*, *tf.Tensor*]] A dictionary that maps graph elements to values

natoms
[*tf.Tensor*] number of atoms

Returns

dict
A dictionary that maps keys to values. It should contain key natoms

```
class deepmd.loss.EnerStdLoss(starter_learning_rate: float, start_pref_e: float = 0.02, limit_pref_e:
    float = 1.0, start_pref_f: float = 1000, limit_pref_f: float = 1.0,
    start_pref_v: float = 0.0, limit_pref_v: float = 0.0, start_pref_ae: float
    = 0.0, limit_pref_ae: float = 0.0, start_pref_pf: float = 0.0,
    limit_pref_pf: float = 0.0, relative_f: float | None = None,
    enable_atom_ener_coeff: bool = False)
```

Bases: *Loss*

Standard loss function for DP models.

Parameters

`enable_atom_ener_coeff`

[*bool*] if true, the energy will be computed as $\sum_i c_i E_i$

Methods

<i>build</i> (learning_rate, natoms, model_dict, ...)	Build the loss function graph.
<i>eval</i> (sess, feed_dict, natoms)	Eval the loss function.

build(learning_rate, natoms, model_dict, label_dict, suffix)

Build the loss function graph.

Parameters

`learning_rate`

[*tf.Tensor*] learning rate

`natoms`

[*tf.Tensor*] number of atoms

`model_dict`

[*dict*[*str*, *tf.Tensor*]] A dictionary that maps model keys to tensors

`label_dict`

[*dict*[*str*, *tf.Tensor*]] A dictionary that maps label keys to tensors

`suffix`

[*str*] suffix

Returns

tf.Tensor

the total squared loss

[*dict*[*str*, *tf.Tensor*]]

A dictionary that maps loss keys to more loss tensors

eval(sess, feed_dict, natoms)

Eval the loss function.

Parameters

`sess`

[*tf.Session*] TensorFlow session

`feed_dict`

[*dict*[*tf.placeholder*, *tf.Tensor*]] A dictionary that maps graph elements to values

natoms
[`tf.Tensor`] number of atoms

Returns

`dict`
A dictionary that maps keys to values. It should contain key natoms

class deepmd.loss.`TensorLoss`(jdata, **kwargs)

Bases: `Loss`

Loss function for tensorial properties.

Methods

<code>build</code> (learning_rate, natoms, model_dict, ...)	Build the loss function graph.
<code>eval</code> (sess, feed_dict, natoms)	Eval the loss function.

`build`(learning_rate, natoms, model_dict, label_dict, suffix)

Build the loss function graph.

Parameters

learning_rate
[`tf.Tensor`] learning rate

natoms
[`tf.Tensor`] number of atoms

model_dict
[`dict[str, tf.Tensor]`] A dictionary that maps model keys to tensors

label_dict
[`dict[str, tf.Tensor]`] A dictionary that maps label keys to tensors

suffix
[`str`] suffix

Returns

`tf.Tensor`
the total squared loss

`dict[str, tf.Tensor]`
A dictionary that maps loss keys to more loss tensors

`eval`(sess, feed_dict, natoms)

Eval the loss function.

Parameters

sess
[`tf.Session`] TensorFlow session

feed_dict
[`dict[tf.placeholder, tf.Tensor]`] A dictionary that maps graph elements to values

natoms
[`tf.Tensor`] number of atoms

Returns

`dict`

A dictionary that maps keys to values. It should contain key `natoms`

Submodules

`deepmd.loss.ener` module

```
class deepmd.loss.ener.EnerDipoleLoss(starter_learning_rate: float, start_pref_e: float = 0.1,
                                       limit_pref_e: float = 1.0, start_pref_ed: float = 1.0,
                                       limit_pref_ed: float = 1.0)
```

Bases: `Loss`

Methods

<code>build</code> (learning_rate, natoms, model_dict, ...)	Build the loss function graph.
<code>eval</code> (sess, feed_dict, natoms)	Eval the loss function.

`build`(learning_rate, natoms, model_dict, label_dict, suffix)

Build the loss function graph.

Parameters

`learning_rate`

`[tf.Tensor]` learning rate

`natoms`

`[tf.Tensor]` number of atoms

`model_dict`

`[dict[str, tf.Tensor]]` A dictionary that maps model keys to tensors

`label_dict`

`[dict[str, tf.Tensor]]` A dictionary that maps label keys to tensors

`suffix`

`[str]` suffix

Returns

`tf.Tensor`

the total squared loss

`dict[str, tf.Tensor]`

A dictionary that maps loss keys to more loss tensors

`eval`(sess, feed_dict, natoms)

Eval the loss function.

Parameters

`sess`

`[tf.Session]` TensorFlow session

`feed_dict`
`[dict[tf.placeholder, tf.Tensor]]` A dictionary that maps graph elements to values

`natoms`
`[tf.Tensor]` number of atoms

Returns

`dict`
 A dictionary that maps keys to values. It should contain key `natoms`

```
class deepmd.loss.ener.EnerStdLoss(starter_learning_rate: float, start_pref_e: float = 0.02,
                                   limit_pref_e: float = 1.0, start_pref_f: float = 1000, limit_pref_f:
                                   float = 1.0, start_pref_v: float = 0.0, limit_pref_v: float = 0.0,
                                   start_pref_ae: float = 0.0, limit_pref_ae: float = 0.0,
                                   start_pref_pf: float = 0.0, limit_pref_pf: float = 0.0, relative_f:
                                   float | None = None, enable_atom_ener_coeff: bool = False)
```

Bases: *Loss*

Standard loss function for DP models.

Parameters

`enable_atom_ener_coeff`
`[bool]` if true, the energy will be computed as $\sum_i c_i E_i$

Methods

<i>build</i> (learning_rate, natoms, model_dict, ...)	Build the loss function graph.
<i>eval</i> (sess, feed_dict, natoms)	Eval the loss function.

build(learning_rate, natoms, model_dict, label_dict, suffix)

Build the loss function graph.

Parameters

`learning_rate`
`[tf.Tensor]` learning rate

`natoms`
`[tf.Tensor]` number of atoms

`model_dict`
`[dict[str, tf.Tensor]]` A dictionary that maps model keys to tensors

`label_dict`
`[dict[str, tf.Tensor]]` A dictionary that maps label keys to tensors

`suffix`
`[str]` suffix

Returns

`tf.Tensor`
 the total squared loss

`dict[str, tf.Tensor]`
 A dictionary that maps loss keys to more loss tensors

```
eval(sess, feed_dict, natoms)
```

Eval the loss function.

Parameters

`sess`

[`tf.Session`] TensorFlow session

`feed_dict`

[`dict`[`tf.placeholder`, `tf.Tensor`]] A dictionary that maps graph elements to values

`natoms`

[`tf.Tensor`] number of atoms

Returns

`dict`

A dictionary that maps keys to values. It should contain key `natoms`

deepmd.loss.loss module

```
class deepmd.loss.loss.Loss
```

Bases: `object`

The abstract class for the loss function.

Methods

<code>build</code> (learning_rate, natoms, model_dict, ...)	Build the loss function graph.
<code>eval</code> (sess, feed_dict, natoms)	Eval the loss function.

```
abstract build(learning_rate: Tensor, natoms: Tensor, model_dict: Dict[str, Tensor], label_dict: Dict[str, Tensor], suffix: str) → Tuple[Tensor, Dict[str, Tensor]]
```

Build the loss function graph.

Parameters

`learning_rate`

[`tf.Tensor`] learning rate

`natoms`

[`tf.Tensor`] number of atoms

`model_dict`

[`dict`[`str`, `tf.Tensor`]] A dictionary that maps model keys to tensors

`label_dict`

[`dict`[`str`, `tf.Tensor`]] A dictionary that maps label keys to tensors

`suffix`

[`str`] suffix

Returns

`tf.Tensor`

the total squared loss

`dict[str, tf.Tensor]`

A dictionary that maps loss keys to more loss tensors

abstract eval(sess: Session, feed_dict: Dict[placeholder, Tensor], natoms: Tensor) → dict

Eval the loss function.

Parameters

sess

[`tf.Session`] TensorFlow session

feed_dict

[dict[`tf.placeholder`, `tf.Tensor`]] A dictionary that maps graph elements to values

natoms

[`tf.Tensor`] number of atoms

Returns

dict

A dictionary that maps keys to values. It should contain key natoms

deepmd.loss.tensor module

class deepmd.loss.tensor.TensorLoss(jdata, **kwargs)

Bases: *Loss*

Loss function for tensorial properties.

Methods

<i>build</i> (learning_rate, natoms, model_dict, ...)	Build the loss function graph.
<i>eval</i> (sess, feed_dict, natoms)	Eval the loss function.

build(learning_rate, natoms, model_dict, label_dict, suffix)

Build the loss function graph.

Parameters

learning_rate

[`tf.Tensor`] learning rate

natoms

[`tf.Tensor`] number of atoms

model_dict

[dict[str, `tf.Tensor`]] A dictionary that maps model keys to tensors

label_dict

[dict[str, `tf.Tensor`]] A dictionary that maps label keys to tensors

suffix

[`str`] suffix

Returns

```

    tf.Tensor
        the total squared loss

    dict[str, tf.Tensor]
        A dictionary that maps loss keys to more loss tensors

```

eval(sess, feed_dict, natoms)

Eval the loss function.

Parameters

sess
[**tf.Session**] TensorFlow session

feed_dict
[**dict**[**tf.placeholder**, **tf.Tensor**]] A dictionary that maps graph elements to values

natoms
[**tf.Tensor**] number of atoms

Returns

dict
A dictionary that maps keys to values. It should contain key natoms

deepmd.model package

```
class deepmd.model.DipoleModel(*args, **kwargs)
```

Bases: *TensorModel*

Methods

build (coord_, atype_, natoms, box, mesh, ...)	Build the model.
build_descrpt (coord_, atype_, natoms, box, ...)	Build the descriptor part of the model.
init_variables (graph, graph_def[, ...])	Init the embedding net variables with the given frozen model.

data_stat
get_ntypes
get_out_size
get_rcut
get_sel_type
get_type_map

```
class deepmd.model.EnerModel(descrpt, fitting, typeebd=None, type_map: List[str] | None = None,
                             data_stat_nbatch: int = 10, data_stat_protect: float = 0.01, use_srtab:
                             str | None = None, smin_alpha: float | None = None, sw_rmin: float |
                             None = None, sw_rmax: float | None = None)
```

Bases: *Model*

Energy model.

Parameters

`descript`
Descriptor

`fitting`
Fitting net

`type_map`
Mapping atom type to the name (str) of the type. For example `type_map[1]` gives the name of the type 1.

`data_stat_nbatch`
Number of frames used for data statistic

`data_stat_protect`
Protect parameter for atomic energy regression

`use_srtab`
The table for the short-range pairwise interaction added on top of DP. The table is a text data file with $(N_t + 1) * N_t / 2 + 1$ columns. The first column is the distance between atoms. The second to the last columns are energies for pairs of certain types. For example we have two atom types, 0 and 1. The columns from 2nd to 4th are for 0-0, 0-1 and 1-1 correspondingly.

`smin_alpha`
The short-range tabulated interaction will be swithed according to the distance of the nearest neighbor. This distance is calculated by softmin. This parameter is the decaying parameter in the softmin. It is only required when `use_srtab` is provided.

`sw_rmin`
The lower boundary of the interpolation between short-range tabulated interaction and DP. It is only required when `use_srtab` is provided.

`sw_rmin`
The upper boundary of the interpolation between short-range tabulated interaction and DP. It is only required when `use_srtab` is provided.

Methods

<code>build(coord_, atype_, natoms, box, mesh, ...)</code>	Build the model.
<code>build_descript(coord_, atype_, natoms, box, ...)</code>	Build the descriptor part of the model.
<code>init_variables(graph, graph_def[, ...])</code>	Init the embedding net variables with the given frozen model.

<code>data_stat</code>
<code>get_ntypes</code>
<code>get_rcut</code>
<code>get_type_map</code>

`build(coord_, atype_, natoms, box, mesh, input_dict, frz_model=None, ckpt_meta: str | None = None, suffix="", reuse=None)`

Build the model.

Parameters

```
coord_  
    [tf.Tensor] The coordinates of atoms  
atype_  
    [tf.Tensor] The atom types of atoms  
natoms  
    [tf.Tensor] The number of atoms  
box  
    [tf.Tensor] The box vectors  
mesh  
    [tf.Tensor] The mesh vectors  
input_dict  
    [dict] The input dict  
frz_model  
    [str, optional] The path to the frozen model  
ckpt_meta  
    [str, optional] The path to the checkpoint and meta file  
suffix  
    [str, optional] The suffix of the scope  
reuse  
    [bool or tf.AUTO_REUSE, optional] Whether to reuse the variables  
Returns  
    dict  
        The output dict  
data_stat(data)  
get_ntypes()  
get_rcut()  
get_type_map()  
init_variables(graph: Graph, graph_def: GraphDef, model_type: str = 'original_model', suffix: str  
               = '') → None  
    Init the embedding net variables with the given frozen model.  
Parameters  
    graph  
        [tf.Graph] The input frozen model graph  
    graph_def  
        [tf.GraphDef] The input frozen model graph_def  
    model_type  
        [str] the type of the model  
    suffix  
        [str] suffix to name scope  
model_type = 'ener'
```

```
class deepmd.model.GlobalPolarModel(*args, **kwargs)
```

Bases: *TensorModel*

Methods

<code>build(coord_, atype_, natoms, box, mesh, ...)</code>	Build the model.
<code>build_descrpt(coord_, atype_, natoms, box, ...)</code>	Build the descriptor part of the model.
<code>init_variables(graph, graph_def[, ...])</code>	Init the embedding net variables with the given frozen model.

data_stat
get_ntypes
get_out_size
get_rcut
get_sel_type
get_type_map

```
class deepmd.model.MultiModel(descrpt, fitting_dict, fitting_type_dict, typeebd=None, type_map:
    List[str] | None = None, data_stat_nbatch: int = 10, data_stat_protect:
    float = 0.01, use_srtab: str | None = None, smin_alpha: float | None =
    None, sw_rmin: float | None = None, sw_rmax: float | None = None)
```

Bases: *Model*

Multi-task model.

Parameters

`descrpt`

Descriptor

`fitting_dict`

Dictionary of fitting nets

`fitting_type_dict`

Dictionary of types of fitting nets

`typeebd`

Type embedding net

`type_map`

Mapping atom type to the name (str) of the type. For example `type_map[1]` gives the name of the type 1.

`data_stat_nbatch`

Number of frames used for data statistic

`data_stat_protect`

Protect parameter for atomic energy regression

`use_srtab`

The table for the short-range pairwise interaction added on top of DP. The table is a text data file with $(N_t + 1) * N_t / 2 + 1$ columns. The first column is the distance between atoms. The second to the last columns are energies for pairs of certain types. For example we have two atom types, 0 and 1. The columns from 2nd to 4th are for 0-0, 0-1 and 1-1 correspondingly.

- `smin_alpha`
The short-range tabulated interaction will be swithed according to the distance of the nearest neighbor. This distance is calculated by softmin. This parameter is the decaying parameter in the softmin. It is only required when `use_srtab` is provided.
- `sw_rmin`
The lower boundary of the interpolation between short-range tabulated interaction and DP. It is only required when `use_srtab` is provided.
- `sw_rmin`
The upper boundary of the interpolation between short-range tabulated interaction and DP. It is only required when `use_srtab` is provided.

Methods

<code>build(coord_, atype_, natoms, box, mesh, ...)</code>	Build the model.
<code>build_descrpt(coord_, atype_, natoms, box, ...)</code>	Build the descriptor part of the model.
<code>init_variables(graph, graph_def[, ...])</code>	Init the embedding net variables with the given frozen model.

<code>data_stat</code>
<code>get_ntypes</code>
<code>get_rcut</code>
<code>get_type_map</code>

build(coord_, atype_, natoms, box, mesh, input_dict, frz_model=None, ckpt_meta: `str` | `None` = `None`, suffix="", reuse=None)

Build the model.

Parameters

- `coord_`
[`tf.Tensor`] The coordinates of atoms
- `atype_`
[`tf.Tensor`] The atom types of atoms

[`str`, optional] The path to the checkpoint and meta file

```

    suffix
        [str, optional] The suffix of the scope

    reuse
        [bool or tf.AUTO_REUSE, optional] Whether to reuse the variables

Returns
    dict
        The output dict

data_stat(data)

get_ntypes()

get_rcut()

get_type_map()

init_variables(graph: Graph, graph_def: GraphDef, model_type: str = 'original_model', suffix: str
               = '') → None

    Init the embedding net variables with the given frozen model.

Parameters
    graph
        [tf.Graph] The input frozen model graph

    graph_def
        [tf.GraphDef] The input frozen model graph_def

    model_type
        [str] the type of the model

    suffix
        [str] suffix to name scope

model_type = 'multi_task'

class deepmd.model.PolarModel(*args, **kwargs)
    Bases: TensorModel

```

Methods

<code>build(coord_, atype_, natoms, box, mesh, ...)</code>	Build the model.
<code>build_descrpt(coord_, atype_, natoms, box, ...)</code>	Build the descriptor part of the model.
<code>init_variables(graph, graph_def[, ...])</code>	Init the embedding net variables with the given frozen model.

<code>data_stat</code>
<code>get_ntypes</code>
<code>get_out_size</code>
<code>get_rcut</code>
<code>get_sel_type</code>
<code>get_type_map</code>

```

Submodules

deepmd.model.ener module

```
class deepmd.model.ener.EnerModel(descrpt, fitting, typeebd=None, type_map: List[str] | None =
    None, data_stat_nbatch: int = 10, data_stat_protect: float = 0.01,
    use_srtab: str | None = None, smin_alpha: float | None = None,
    sw_rmin: float | None = None, sw_rmax: float | None = None)
```

Bases: *Model*

Energy model.

Parameters

`descrpt`
Descriptor

`fitting`
Fitting net

`type_map`
Mapping atom type to the name (str) of the type. For example `type_map[1]` gives the name of the type 1.

`data_stat_nbatch`
Number of frames used for data statistic

`data_stat_protect`
Protect parameter for atomic energy regression

`use_srtab`
The table for the short-range pairwise interaction added on top of DP. The table is a text data file with $(N_t + 1) * N_t / 2 + 1$ columns. The first column is the distance between atoms. The second to the last columns are energies for pairs of certain types.

For example we have two atom types, 0 and 1. The columns from 2nd to 4th are for 0-0, 0-1 and 1-1 correspondingly.

`smin_alpha`

The short-range tabulated interaction will be swithed according to the distance of the nearest neighbor. This distance is calculated by `softmin`. This parameter is the decaying parameter in the `softmin`. It is only required when `use_srtab` is provided.

`sw_rmin`

The lower boundary of the interpolation between short-range tabulated interaction and DP. It is only required when `use_srtab` is provided.

`sw_rmin`

The upper boundary of the interpolation between short-range tabulated interaction and DP. It is only required when `use_srtab` is provided.

Methods

<code>build(coord_, atype_, natoms, box, mesh, ...)</code>	Build the model.
<code>build_descrpt(coord_, atype_, natoms, box, ...)</code>	Build the descriptor part of the model.
<code>init_variables(graph, graph_def[, ...])</code>	Init the embedding net variables with the given frozen model.

<code>data_stat</code>
<code>get_ntypes</code>
<code>get_rcut</code>
<code>get_type_map</code>

`build(coord_, atype_, natoms, box, mesh, input_dict, frz_model=None, ckpt_meta: str | None = None, suffix='', reuse=None)`

Build the model.

Parameters

`coord_`
[`tf.Tensor`] The coordinates of atoms

`atype_`
[`tf.Tensor`] The atom types of atoms

`natoms`
[`tf.Tensor`] The number of atoms

`box`
[`tf.Tensor`] The box vectors

`mesh`
[`tf.Tensor`] The mesh vectors

`input_dict`
[`dict`] The input dict

`frz_model`
[`str`, `optional`] The path to the frozen model

```

    ckpt_meta
        [str, optional] The path to the checkpoint and meta file
    suffix
        [str, optional] The suffix of the scope
    reuse
        [bool or tf.AUTO_REUSE, optional] Whether to reuse the variables
Returns
    dict
        The output dict
data_stat(data)
get_ntypes()
get_rcut()
get_type_map()
init_variables(graph: Graph, graph_def: GraphDef, model_type: str = 'original_model', suffix: str
               = '') → None
    Init the embedding net variables with the given frozen model.
Parameters
    graph
        [tf.Graph] The input frozen model graph
    graph_def
        [tf.GraphDef] The input frozen model graph_def
    model_type
        [str] the type of the model
    suffix
        [str] suffix to name scope
model_type = 'ener'

```

deepmd.model.model module

```
class deepmd.model.model.Model
```

Bases: ABC

Methods

<i>build</i> (coord_, atype_, natoms, box, mesh, ...)	Build the model.
<i>build_descriptor</i> (coord_, atype_, natoms, box, ...)	Build the descriptor part of the model.
<i>init_variables</i> (graph, graph_def[, ...])	Init the embedding net variables with the given frozen model.

```
abstract build(coord_: Tensor, atype_: Tensor, natoms: Tensor, box: Tensor, mesh: Tensor,
               input_dict: dict, frz_model: str | None = None, ckpt_meta: str | None = None, suffix:
               str = "", reuse: bool | Enum | None = None)
```

Build the model.

Parameters

```
coord_
    [tf.Tensor] The coordinates of atoms

atype_
    [tf.Tensor] The atom types of atoms

natoms
    [tf.Tensor] The number of atoms

box
    [tf.Tensor] The box vectors

mesh
    [tf.Tensor] The mesh vectors

input_dict
    [dict] The input dict

frz_model
    [str, optional] The path to the frozen model

ckpt_meta
    [str, optional] The path to the checkpoint and meta file

suffix
    [str, optional] The suffix of the scope

reuse
    [bool or tf.AUTO_REUSE, optional] Whether to reuse the variables
```

Returns

```
dict
    The output dict
```

```
build_descrpt(coord_: Tensor, atype_: Tensor, natoms: Tensor, box: Tensor, mesh: Tensor,
               input_dict: dict, frz_model: str | None = None, ckpt_meta: str | None = None, suffix:
               str = "", reuse: bool | Enum | None = None)
```

Build the descriptor part of the model.

Parameters

```
coord_
    [tf.Tensor] The coordinates of atoms

atype_
    [tf.Tensor] The atom types of atoms

natoms
    [tf.Tensor] The number of atoms

box
    [tf.Tensor] The box vectors

mesh
    [tf.Tensor] The mesh vectors
```

`input_dict`
[dict] The input dict

`frz_model`
[str, optional] The path to the frozen model

`ckpt_meta`
[str, optional] The path to the checkpoint and meta file

`suffix`
[str, optional] The suffix of the scope

`reuse`
[bool or tf.AUTO_REUSE, optional] Whether to reuse the variables

Returns

`tf.Tensor`
The descriptor tensor

`init_variables`(graph: Graph, graph_def: GraphDef, model_type: str = 'original_model', suffix: str = '') → None

Init the embedding net variables with the given frozen model.

Parameters

`graph`
[tf.Graph] The input frozen model graph

`graph_def`
[tf.GraphDef] The input frozen model graph_def

`model_type`
[str] the type of the model

`suffix`
[str] suffix to name scope

deepmd.model.model_stat module

`deepmd.model.model_stat.make_stat_input`(data, nbatches, merge_sys=True)

Pack data for statistics.

Parameters

`data`
The data

`nbatches`
[int] The number of batches

`merge_sys`
[bool (True)] Merge system data

Returns

`all_stat`:
A dictionary of list of list storing data for stat. if merge_sys == False data can be accessed by

`all_stat[key][sys_idx][batch_idx][frame_idx]`

```

else merge_sys == True can be accessed by
    all_stat[key][batch_idx][frame_idx]

```

```
deepmd.model.model_stat.merge_sys_stat(all_stat)
```

deepmd.model.multi module

```

class deepmd.model.multi.MultiModel(descrpt, fitting_dict, fitting_type_dict, typeebd=None,
                                     type_map: List[str] | None = None, data_stat_nbatch: int = 10,
                                     data_stat_protect: float = 0.01, use_srtab: str | None = None,
                                     smin_alpha: float | None = None, sw_rmin: float | None = None,
                                     sw_rmax: float | None = None)

```

Bases: *Model*

Multi-task model.

Parameters

descrpt
Descriptor

fitting_dict
Dictionary of fitting nets

fitting_type_dict
Dictionary of types of fitting nets

typeebd
Type embedding net

type_map
Mapping atom type to the name (str) of the type. For example `type_map[1]` gives the name of the type 1.

data_stat_nbatch
Number of frames used for data statistic

data_stat_protect
Protect parameter for atomic energy regression

use_srtab
The table for the short-range pairwise interaction added on top of DP. The table is a text data file with $(N_t + 1) * N_t / 2 + 1$ columes. The first columes is the distance between atoms. The second to the last columes are energies for pairs of certain types. For example we have two atom types, 0 and 1. The columes from 2nd to 4th are for 0-0, 0-1 and 1-1 correspondingly.

smin_alpha
The short-range tabulated interaction will be swithed according to the distance of the nearest neighbor. This distance is calculated by softmin. This parameter is the decaying parameter in the softmin. It is only required when `use_srtab` is provided.

sw_rmin
The lower boundary of the interpolation between short-range tabulated interaction and DP. It is only required when `use_srtab` is provided.

sw_rmin
The upper boundary of the interpolation between short-range tabulated interaction and DP. It is only required when `use_srtab` is provided.

Methods

<i>build</i> (coord_, atype_, natoms, box, mesh, ...)	Build the model.
<i>build_descrpt</i> (coord_, atype_, natoms, box, ...)	Build the descriptor part of the model.
<i>init_variables</i> (graph, graph_def[, ...])	Init the embedding net variables with the given frozen model.

data_stat
get_ntypes
get_rcut
get_type_map

build(coord_, atype_, natoms, box, mesh, input_dict, frz_model=None, ckpt_meta: str | None = None, suffix='', reuse=None)

Build the model.

Parameters

coord_
[[tf.Tensor](#)] The coordinates of atoms

atype_
[[tf.Tensor](#)] The atom types of atoms

natoms
[[tf.Tensor](#)] The number of atoms

box
[[tf.Tensor](#)] The box vectors

mesh
[[tf.Tensor](#)] The mesh vectors

input_dict
[[dict](#)] The input dict

frz_model
[[str](#), optional] The path to the frozen model

ckpt_meta
[[str](#), optional] The path to the checkpoint and meta file

suffix
[[str](#), optional] The suffix of the scope

reuse
[[bool](#) or [tf.AUTO_REUSE](#), optional] Whether to reuse the variables

Returns

[dict](#)
The output dict

data_stat(data)

get_ntypes()

```
get_rcut()
```

```
get_type_map()
```

```
init_variables(graph: Graph, graph_def: GraphDef, model_type: str = 'original_model', suffix: str = '') → None
```

Init the embedding net variables with the given frozen model.

Parameters

graph

[`tf.Graph`] The input frozen model graph

graph_def

[`tf.GraphDef`] The input frozen model graph_def

model_type

[`str`] the type of the model

suffix

[`str`] suffix to name scope

```
model_type = 'multi_task'
```

deepmd.model.tensor module

```
class deepmd.model.tensor.DipoleModel(*args, **kwargs)
```

Bases: *TensorModel*

Methods

<code>build(coord_, atype_, natoms, box, mesh, ...)</code>	Build the model.
<code>build_descrpt(coord_, atype_, natoms, box, ...)</code>	Build the descriptor part of the model.
<code>init_variables(graph, graph_def[, ...])</code>	Init the embedding net variables with the given frozen model.

```

    List[str] | None = None, data_stat_nbatch: int = 10,
    data_stat_protect: float = 0.01)
```

Bases: *Model*

Tensor model.

Parameters

`tensor_name`
Name of the tensor.

`descrpt`
Descriptor

`fitting`
Fitting net

`typeebd`
 Type embedding net
`type_map`
 Mapping atom type to the name (str) of the type. For example `type_map[1]` gives the name of the type 1.
`data_stat_nbatch`
 Number of frames used for data statistic
`data_stat_protect`
 Protect parameter for atomic energy regression

Methods

<code>build(coord_, atype_, natoms, box, mesh, ...)</code>	Build the model.
<code>build_descrpt(coord_, atype_, natoms, box, ...)</code>	Build the descriptor part of the model.
<code>init_variables(graph, graph_def[, ...])</code>	Init the embedding net variables with the given frozen model.

<code>data_stat</code>
<code>get_ntypes</code>
<code>get_out_size</code>
<code>get_rcut</code>
<code>get_sel_type</code>
<code>get_type_map</code>

`build(coord_, atype_, natoms, box, mesh, input_dict, frz_model=None, ckpt_meta: str | None = None, suffix="", reuse=None)`

Build the model.

Parameters

`coord_`
`[tf.Tensor]` The coordinates of atoms
`atype_`
`[tf.Tensor]` The atom types of atoms
`natoms`
`[tf.Tensor]` The number of atoms
`box`
`[tf.Tensor]` The box vectors
`mesh`
`[tf.Tensor]` The mesh vectors
`input_dict`
`[dict]` The input dict
`frz_model`
`[str, optional]` The path to the frozen model
`ckpt_meta`
`[str, optional]` The path to the checkpoint and meta file

```

    suffix
        [str, optional] The suffix of the scope

    reuse
        [bool or tf.AUTO_REUSE, optional] Whether to reuse the variables

Returns
    dict
        The output dict

data_stat(data)

get_ntypes()

get_type_map()

init_variables(graph: Graph, graph_def: GraphDef, model_type: str = 'original_model', suffix: str
              = '') → None
    Init the embedding net variables with the given frozen model.

Parameters
    graph
        [tf.Graph] The input frozen model graph

    graph_def
        [tf.GraphDef] The input frozen model graph_def

    model_type
        [str] the type of the model

    suffix
        [str] suffix to name scope

Submodules

deepmd.nvnmd.data.data module

deepmd.nvnmd.descriptor package

`nvnmmd.se_a` =====.

Provides

1. building descriptor with continuous embedding network
2. building descriptor with quantized embedding network

Submodules

deepmd.nvnmd.descriptor.se_a module

`deepmd.nvnmd.descriptor.se_a.build_davg_dstd()`

Get the davg and dstd from the dictionary `nvnmmd_cfg`. The davg and dstd have been obtained by training CNN.

`deepmd.nvnmd.descriptor.se_a.build_op_descriptor()`

Replace `se_a.py/DescrptSeA/build`.

`deepmd.nvnmd.descriptor.se_a.check_switch_range(davg, dstd)`

Check the range of switch, let it in range $[-2, 14]$.

`deepmd.nvnmd.descriptor.se_a.descrpt2r4(inputs, natoms)`

Replace $r_{ji} \rightarrow r'_{ji}$ where $r_{ji} = (x_{ji}, y_{ji}, z_{ji})$ and $r'_{ji} = (s_{ji}, \frac{s_{ji}x_{ji}}{r_{ji}}, \frac{s_{ji}y_{ji}}{r_{ji}}, \frac{s_{ji}z_{ji}}{r_{ji}})$.

`deepmd.nvnmd.descriptor.se_a.filter_GR2D(xyz_scatter_1)`

Replace `se_a.py/_filter`.

`deepmd.nvnmd.descriptor.se_a.filter_lower_R42GR(type_i, type_input, inputs_i, is_exclude, activation_fn, bavg, stddev, trainable, suffix, seed, seed_shift, uniform_seed, filter_neuron, filter_precision, filter_resnet_dt, embedding_net_variables)`

Replace `se_a.py/DescrptSeA/_filter_lower`.

deepmd.nvnmd.entrpoints package

```
class deepmd.nvnmd.entrpoints.MapTable(config_file: str, weight_file: str, map_file: str)
```

Bases: `object`

Generate the mapping table describing the relationship of atomic distance, cutoff function, and embedding matrix.

three mapping table will be built:

$$r_{ji}^2 \rightarrow s_{ji}$$

$$r_{ji}^2 \rightarrow h_{ji}$$

$$r_{ji}^2 \rightarrow \mathcal{G}_{ji}$$

where s_{ji} is cut-off function, $h_{ji} = \frac{s(r_{ji})}{r_{ji}}$, and \mathcal{G}_{ji} is embedding matrix.

The mapping function can be define as:

$$y = f(x) = y_k + (x - x_k) * dy_k$$

$$y_k = f(x_k)$$

$$dy_k = \frac{f(x_{k+1}) - f(x_k)}{dx}$$

$$x_k \leq x < x_{k+1}$$

$$x_k = k * dx$$

where dx is interpolation interval.

Parameters

`config_file`

input file name an .npz file containing the configuration information of NVNMD model

`weight_file`

input file name an .npz file containing the weights of NVNMD model

`map_file`

output file name an .npz file containing the mapping tables of NVNMD model

DOI: 10.1038/s41524-022-00773-z

Methods

<i>build_grad</i> (x, y, Nr, Nc)	: Build gradient of tensor y of x.
<i>build_map_coef</i> (cfgs, x, ys, grads, ...[, rank])	Build mapping table coefficient cfgs: cfg list cfg = x0, x1, dx.
<i>build_s2g</i> (s)	Build s->G s is switch function G is embedding net output.
<i>build_s2g_grad</i> ()	Build gradient of G with respect to s.
<i>build_u2s</i> (r2)	Build tensor s, s=s(r2).
<i>build_u2s_grad</i> ()	Build gradient of s with respect to u (r^2).
<i>mapping</i> (x, dic_map, cfgs[, rank])	Evaluate value by mapping table operation of tensorflow.
<i>mapping2</i> (x, dic_map, cfgs[, rank])	Evaluate value by mapping table of numpy.
<i>plot_lines</i> (x, dic1[, dic2])	Plot lines to see accuracy.
<i>run_s2g</i> ()	Build s-> graph and run it to get value of mapping table.
<i>run_u2s</i> ()	Build u->s graph and run it to get value of mapping table.

build_map

build_grad(x, y, Nr, Nc)

: Build gradient of tensor y of x.

build_map()

build_map_coef(cfgs, x, ys, grads, grad_grads, Nr, Nc, rank=4)

Build mapping table coefficient cfgs: cfg list cfg = x0, x1, dx.

coef2: $a x + b = y / b = y_0 \quad a = (y_1 - y_0) / L$

coef4: $a x^3 + b x^2 + c x + d = y: / d = y_0 \mid c = y_0' \mid b = (3 y_1 - dx dy' - 2 dx y_0' - 3 y_0) / dx^2 \quad a = (dx y_1' - 2 y_1 + dx y_0' + 2 y_0) / dx^3$

build_s2g(s)

Build s->G s is switch function G is embedding net output.

build_s2g_grad()

Build gradient of G with respect to s.

build_u2s(r2)

Build tensor s, s=s(r2).

build_u2s_grad()

Build gradient of s with respect to u (r^2).

mapping(x, dic_map, cfgs, rank=4)

Evaluate value by mapping table operation of tensorflow.

mapping2(x, dic_map, cfgs, rank=4)

Evaluate value by mapping table of numpy.

plot_lines(x, dic1, dic2=None)

Plot lines to see accuracy.

`run_s2g()`

Build s-> graph and run it to get value of mapping table.

`run_u2s()`

Build u->s graph and run it to get value of mapping table.

`class deepmd.nvnmd.entrypoints.Wrap(config_file: str, weight_file: str, map_file: str, model_file: str)`

Bases: `object`

Generate the binary model file (model.pb).

the model file can be use to run the NVNMD with lammmps the pair style need set as:

```
pair_style nvnmd model.pb
pair_coeff * *
```

Parameters

`config_file`

input file name an .npz file containing the configuration information of NVNMD model

`weight_file`

input file name an .npz file containing the weights of NVNMD model

`map_file`

input file name an .npz file containing the mapping tables of NVNMD model

`model_file`

output file name an .pb file containing the model using in the NVNMD

Wrap the configuration of descriptor.

[NBIT_IDX_S2G-1:0] SHIFT_IDX_S2G [NBIT_NEIB*NTYPE-1:0] SELs
[NBIT_FIXD*M1*NTYPE*NTYPE-1:0] GSs [NBIT_FLTE-1:0] NEXPO_DIV_NI

wrap_fitn()

Wrap the weights of fitting net.

wrap_head(nhs, nws)

wrap_map()

Wrap the mapping table of embedding network.

wrap_weight(weight, NBIT_DISP, NBIT_WEIGHT)

weight: weights of fittingNet NBIT_DISP: nbits of exponent of weight max value NBIT_WEIGHT:
nbits of mantissa of weights.

`deepmd.nvnmd.entrypoints.save_weight(sess, file_name: str = 'nvnmd/weight.npy')`

Save the dictionary of weight to a npy file.

Submodules

`deepmd.nvnmd.entrypoints.freeze` module

`deepmd.nvnmd.entrypoints.freeze.filter_tensorVariableList(tensorVariableList) → dict`

Get the name of variable for NVNMD.

```
train_attr/min_nbor_dist
descript_attr/t_avg:0
descript_attr/t_std:0
filter_type_{atom i}/matrix_{layer l}_{atomj}:0
filter_type_{atom i}/bias_{layer l}_{atomj}:0
layer_{layer l}_type_{atom i}/matrix:0
layer_{layer l}_type_{atom i}/bias:0
final_layer_type_{atom i}/matrix:0
final_layer_type_{atom i}/bias:0
```

`deepmd.nvnmd.entrypoints.freeze.save_weight(sess, file_name: str = 'nvnmd/weight.npy')`

Save the dictionary of weight to a npy file.

deepmd.nvnmd.entrypoints.mapt module

`class deepmd.nvnmd.entrypoints.mapt.MapTable(config_file: str, weight_file: str, map_file: str)`

Bases: `object`

Generate the mapping table describing the relationship of atomic distance, cutoff function, and embedding matrix.

three mapping table will be built:

$$r_{ji}^2 \rightarrow s_{ji}$$

$$r_{ji}^2 \rightarrow h_{ji}$$

$$r_{ji}^2 \rightarrow \mathcal{G}_{ji}$$

where s_{ji} is cut-off function, $h_{ji} = \frac{s(r_{ji})}{r_{ji}}$, and \mathcal{G}_{ji} is embedding matrix.

The mapping function can be define as:

$$y = f(x) = y_k + (x - x_k) * dy_k$$

$$y_k = f(x_k)$$

$$dy_k = \frac{f(x_{k+1}) - f(x_k)}{dx}$$

$$x_k \leq x < x_{k+1}$$

$$x_k = k * dx$$

where dx is interpolation interval.

Parameters

`config_file`

input file name an .npz file containing the configuration information of NVNMD model

`weight_file`

input file name an .npz file containing the weights of NVNMD model

`map_file`

output file name an .npz file containing the mapping tables of NVNMD model

Methods

<i>build_grad</i> (x, y, Nr, Nc)	: Build gradient of tensor y of x.
<i>build_map_coef</i> (cfgs, x, ys, grads, ...[, rank])	Build mapping table coefficient cfgs: cfg list cfg = x0, x1, dx.
<i>build_s2g</i> (s)	Build s->G s is switch function G is embedding net output.
<i>build_s2g_grad</i> ()	Build gradient of G with respect to s.
<i>build_u2s</i> (r2)	Build tensor s, s=s(r2).
<i>build_u2s_grad</i> ()	Build gradient of s with respect to u (r^2).
<i>mapping</i> (x, dic_map, cfgs[, rank])	Evaluate value by mapping table operation of tensorflow.
<i>mapping2</i> (x, dic_map, cfgs[, rank])	Evaluate value by mapping table of numpy.
<i>plot_lines</i> (x, dic1[, dic2])	Plot lines to see accuracy.
<i>run_s2g</i> ()	Build s-> graph and run it to get value of mapping table.
<i>run_u2s</i> ()	Build u->s graph and run it to get value of mapping table.

build_map

build_grad(x, y, Nr, Nc)

: Build gradient of tensor y of x.

build_map()

build_map_coef(cfgs, x, ys, grads, grad_grads, Nr, Nc, rank=4)

Build mapping table coefficient cfgs: cfg list cfg = x0, x1, dx.

coef2: $a x + b = y / b = y_0 \quad a = (y_1 - y_0) / L$

coef4: $a x^3 + b x^2 + c x + d = y: / d = y_0 \mid c = y_0' \mid b = (3 y_1 - dx dy' - 2 dx y_0' - 3 y_0) / dx^2 \quad a = (dx y_1' - 2 y_1 + dx y_0' + 2 y_0) / dx^3$

build_s2g(s)

Build s->G s is switch function G is embedding net output.

build_s2g_grad()

Build gradient of G with respect to s.

build_u2s(r2)

Build tensor s, s=s(r2).

build_u2s_grad()

Build gradient of s with respect to u (r^2).

mapping(x, dic_map, cfgs, rank=4)

Evaluate value by mapping table operation of tensorflow.

mapping2(x, dic_map, cfgs, rank=4)

Evaluate value by mapping table of numpy.

plot_lines(x, dic1, dic2=None)

Plot lines to see accuracy.

```
run_s2g()
```

Build s-> graph and run it to get value of mapping table.

```
run_u2s()
```

Build u->s graph and run it to get value of mapping table.

```
deepmd.nvnmd.entrypoints.mapt.mapt(*, nvnmd_config: str | None = 'nvnmd/config.npy',
                                     nvnmd_weight: str | None = 'nvnmd/weight.npy', nvnmd_map:
                                     str | None = 'nvnmd/map.npy', **kwargs)
```

deepmd.nvnmd.entrypoints.train module

```
deepmd.nvnmd.entrypoints.train.normalized_input(fn, PATH_CNN, CONFIG_CNN)
```

Normalize a input script file for continuous neural network.

```
deepmd.nvnmd.entrypoints.train.normalized_input_qnn(jdata, PATH_QNN, CONFIG_CNN,
                                                    WEIGHT_CNN, MAP_CNN)
```

Normalize a input script file for quantize neural network.

```
deepmd.nvnmd.entrypoints.train.train_nvnmd(*, INPUT: str, restart: str | None, step: str, **kwargs)
```

deepmd.nvnmd.entrypoints.wrap module

```

                                          str)
```

Bases: `object`

Generate the binary model file (model.pb).

the model file can be use to run the NVNMD with lammmps the pair style need set as:

```
pair_style nvnmd model.pb
pair_coeff * *
```

Parameters

`config_file`

input file name an .npy file containing the configuration information of NVNMD model

`weight_file`

input file name an .npy file containing the weights of NVNMD model

`map_file`

input file name an .npy file containing the mapping tables of NVNMD model

`model_file`

output file name an .pb file containing the model using in the NVNMD

deepmd.nvnmd.fit package

nvnmd.fit =====.

Provides

1. continuous fitting network
2. quantized fitting network

Submodules**deepmd.nvnmd.fit.ener module**

```
deepmd.nvnmd.fit.ener.one_layer_nvnmd(inputs, outputs_size, activation_fn=<function tanh>,
                                         precision=tf.float64, stddev=1.0, bavg=0.0, name='linear',
                                         reuse=None, seed=None, use_timestep=False,
                                         trainable=True, useBN=False, uniform_seed=False,
                                         initial_variables=None, mixed_prec=None,
                                         final_layer=False)
```

Build one layer with continuous or quantized value. Its weight and bias can be initialed with random or constant value.

deepmd.nvnmd.utils package

```
class deepmd.nvnmd.utils.Encode
```

Bases: `object`

Encoding value as hex, bin, and dec format.

Methods

<i>bin2hex</i> (data)	Convert binary string list to hex string list.
<i>bin2hex_str</i> (sbin)	Convert binary string to hex string.
<i>byte2hex</i> (bs, nbyte)	Convert byte into hex bs: low byte in the first hex: low byte in the right.
<i>check_dec</i> (idec, nbit[, signed, name])	Check whether the data (idec) is in the range range is $[0, 2^{nbit} - 1]$ for unsigned range is $[-2^{nbit-1}, 2^{nbit-1} - 1]$ for signed.
<i>dec2bin</i> (idec[, nbit, signed, name])	Convert dec array to binary string list.
<i>extend_bin</i> (slbin, nfull)	Extend the element of list (slbin) to the length (nfull).
<i>extend_hex</i> (slhex, nfull)	Extend the element of list (slhex) to the length (nfull).
<i>extend_list</i> (slbin, nfull)	Extend the list (slbin) to the length (nfull) the attached element of list is 0.
<i>flt2bin</i> (data, nbit_expo, nbit_frac)	Convert float into binary string list.
<i>hex2bin</i> (data)	Convert hex string list to binary string list.
<i>hex2bin_str</i> (shex)	Convert hex string to binary string.
<i>merge_bin</i> (slbin, nmerge)	Merge binary string list per nmerge value.
<i>qc</i> (v[, nbit])	Quantize value using ceil.
<i>qf</i> (v[, nbit])	Quantize value using floor.
<i>qr</i> (v[, nbit])	Quantize value using round.
<i>reverse_bin</i> (slbin, nreverse)	Reverse binary string list per nreverse value.
<i>split_bin</i> (sbin, nbit)	Split sbin into many segment with the length nbit.

find_max_expo
flt2bin_one
norm_expo
split_expo_mant

bin2hex(data)

Convert binary string list to hex string list.

bin2hex_str(sbin)

Convert binary string to hex string.

byte2hex(bs, nbyte)

Convert byte into hex bs: low byte in the first hex: low byte in the right.

check_dec(idec, nbit, signed=False, name='')Check whether the data (idec) is in the range range is $[0, 2^{nbit} - 1]$ for unsigned range is $[-2^{nbit-1}, 2^{nbit-1} - 1]$ for signed.**dec2bin**(idec, nbit=10, signed=False, name='')

Convert dec array to binary string list.

extend_bin(slbin, nfull)

Extend the element of list (slbin) to the length (nfull).

such as, when

```

slbin = ['10010','10100'],
nfull = 6

extent to
['010010','010100']
extend_hex(slhex, nfull)
    Extend the element of list (slhex) to the length (nfull).
extend_list(slbin, nfull)
    Extend the list (slbin) to the length (nfull) the attached element of list is 0.
    such as, when

slbin = ['10010','10100'],
nfull = 4

extent it to
['10010','10100','00000','00000']
find_max_expo(v, expo_min=-1000)
flt2bin(data, nbit_expo, nbit_frac)
    Convert float into binary string list.
flt2bin_one(v, nbit_expo, nbit_frac)
hex2bin(data)
    Convert hex string list to binary string list.
hex2bin_str(shex)
    Convert hex string to binary string.
merge_bin(slbin, nmerge)
    Merge binary string list per nmerge value.
norm_expo(v, nbit_frac=20, expo_min=-1000)
qc(v, nbit: int = 14)
    Quantize value using ceil.
qf(v, nbit: int = 14)
    Quantize value using floor.
qr(v, nbit: int = 14)
    Quantize value using round.
reverse_bin(slbin, nreverse)
    Reverse binary string list per nreverse value.
split_bin(sbin, nbit: int)
    Split sbin into many segment with the length nbit.

```

```
split_expo_mant(v, min=-1000)
```

```
class deepmd.nvnmd.utils.FioBin
```

Bases: `object`

Input and output for binary file.

Methods

<code>load([file_name, default_value])</code>	Load binary file into bytes value.
<code>save(file_name, data)</code>	Save hex string into binary file.

```
load(file_name="", default_value="")
```

Load binary file into bytes value.

```
save(file_name: str, data: List[str])
```

Save hex string into binary file.

```
class deepmd.nvnmd.utils.FioDic
```

Bases: `object`

Input and output for dict class data the file can be .json or .npy file containing a dictionary.

Methods

<code>update(jdata, jdata_o)</code>	Update key-value pair is key in jdata_o.keys().
-------------------------------------	---

get
load
save

```
get(jdata, key, default_value)
```

```
load(file_name="", default_value={})
```

```
save(file_name="", dic={})
```

```
update(jdata, jdata_o)
```

Update key-value pair is key in jdata_o.keys().

Parameters

jdata
new jdata

jdata_o
origin jdata

```
class deepmd.nvnmd.utils.FioTxt
```

Bases: `object`

Input and output for .txt file with string.

Methods

<code>load(file_name, default_value)</code>	Load .txt file into string list.
<code>save(file_name, data)</code>	Save string list into .txt file.

`load(file_name="", default_value=[])`

Load .txt file into string list.

`save(file_name: str = "", data: list = [])`

Save string list into .txt file.

`deepmd.nvnmd.utils.get_filter_weight(weights: dict, spe_i: int, spe_j: int, layer_l: int)`

Get weight and bias of embedding network.

Parameters

`weights`

[dict] weights

`spe_i`

[int] special order of central atom i 0~ntype-1

`spe_j`

[int] special order of neighbor atom j 0~ntype-1

`layer_l`

layer order in embedding network 1~nlayer

`deepmd.nvnmd.utils.get_fitnet_weight(weights: dict, spe_i: int, layer_l: int, nlayer: int = 10)`

Get weight and bias of fitting network.

Parameters

`weights`

[dict] weights

`spe_i`

[int] special order of central atom i 0~ntype-1

`layer_l`

[int] layer order in embedding network 0~nlayer-1

`nlayer`

[int] number of layers

`deepmd.nvnmd.utils.map_nvnmd(x, map_y, map_dy, prec, nbit=None)`

Mapping function implemented by numpy.

`deepmd.nvnmd.utils.nvnmd_args()`

`deepmd.nvnmd.utils.one_layer(inputs, outputs_size, activation_fn=<function tanh>, precision=tf.float64, stddev=1.0, bavg=0.0, name='linear', reuse=None, seed=None, use_timestep=False, trainable=True, useBN=False, uniform_seed=False, initial_variables=None, mixed_prec=None, final_layer=False)`

Build one layer with continuous or quantized value. Its weight and bias can be initialed with random or constant value.

Submodules

deepmd.nvnmd.utils.argcheck module

deepmd.nvnmd.utils.argcheck.nvnmd_args()

deepmd.nvnmd.utils.config module

class deepmd.nvnmd.utils.config.NvnmdConfig(jdata: dict)

Bases: object

Configuration for NVNMD record the message of model such as size, using nvnmd or not.

Parameters

jdata
a dictionary of input script

References

DOI: 10.1038/s41524-022-00773-z

Methods

<i>disp_message()</i>	Display the log of NVNMD.
<i>get_deepmd_jdata()</i>	Generate input script with member element one by one.
<i>get_dscp_jdata()</i>	Generate model/descriptor in input script.
<i>get_fitn_jdata()</i>	Generate model/fitting_net in input script.
<i>get_learning_rate_jdata()</i>	Generate learning_rate in input script.
<i>get_loss_jdata()</i>	Generate loss in input script.
<i>get_model_jdata()</i>	Generate model in input script.
<i>get_nvnmd_jdata()</i>	Generate nvnmd in input script.
<i>get_training_jdata()</i>	Generate training in input script.
<i>init_ctrl(jdata[, jdata_parent])</i>	Initial members about control signal.
<i>init_dpin(jdata[, jdata_parent])</i>	initial members about other deepmd input.
<i>init_dscp(jdata[, jdata_parent])</i>	Initial members about descriptor.
<i>init_fitn(jdata[, jdata_parent])</i>	Initial members about fitting network.
<i>init_from_config(jdata)</i>	Initial member element one by one.
<i>init_from_deepmd_input(jdata)</i>	Initial members with input script of deepmd.
<i>init_from_jdata([jdata])</i>	Initial this class with jdata loaded from input script.
<i>init_nbit(jdata[, jdata_parent])</i>	Initial members about quantification precision.
<i>init_net_size()</i>	Initial net_size.
<i>init_size(jdata[, jdata_parent])</i>	Initial members about ram capacity.
<i>init_train_mode([mod])</i>	Configure for taining cnn or qnn.
<i>init_value()</i>	Initial member with dict.
<i>save([file_name])</i>	Save all configuration to file.
<i>update_config()</i>	Update config from dict.

get_s_range

```

disp_message()
    Display the log of NVNMD.

get_deepmd_jdata()
    Generate input script with member element one by one.

get_dscp_jdata()
    Generate model/descriptor in input script.

get_fitn_jdata()
    Generate model/fitting_net in input script.

get_learning_rate_jdata()
    Generate learning_rate in input script.

get_loss_jdata()
    Generate loss in input script.

get_model_jdata()
    Generate model in input script.

get_nvnmd_jdata()
    Generate nvnmd in input script.

get_s_range(davg, dstd)

get_training_jdata()
    Generate training in input script.

init_ctrl(jdata: dict, jdata_parent: dict = {}) → dict
    Initial members about control signal.

init_dpin(jdata: dict, jdata_parent: dict = {}) → dict
    initial members about other deepmd input.

init_dscp(jdata: dict, jdata_parent: dict = {}) → dict
    Initial members about descriptor.

init_fitn(jdata: dict, jdata_parent: dict = {}) → dict
    Initial members about fitting network.

init_from_config(jdata)
    Initial member element one by one.

init_from_deepmd_input(jdata)
    Initial members with input script of deepmd.

init_from_jdata(jdata: dict = {})
    Initial this class with jdata loaded from input script.

init_nbit(jdata: dict, jdata_parent: dict = {}) → dict
    Initial members about quantification precision.

init_net_size()
    Initial net_size.

```

`init_size(jdata: dict, jdata_parent: dict = {}) → dict`

Initial members about ram capacity.

`init_train_mode(mod='cnn')`

Configure for training cnn or qnn.

`init_value()`

Initial member with dict.

`save(file_name=None)`

Save all configuration to file.

`update_config()`

Update config from dict.

deepmd.nvnmd.utils.encode module

`class deepmd.nvnmd.utils.encode.Encode`

Bases: `object`

Encoding value as hex, bin, and dec format.

Methods

<code>bin2hex(data)</code>	Convert binary string list to hex string list.
<code>bin2hex_str(sbin)</code>	Convert binary string to hex string.
<code>byte2hex(bs, nbyte)</code>	Convert byte into hex bs: low byte in the first hex: low byte in the right.
<code>check_dec(idec, nbit[, signed, name])</code>	Check whether the data (idec) is in the range range is $[0, 2^{nbit} - 1]$ for unsigned range is $[-2^{nbit-1}, 2^{nbit-1} - 1]$ for signed.
<code>dec2bin(idec[, nbit, signed, name])</code>	Convert dec array to binary string list.
<code>extend_bin(slbin, nfull)</code>	Extend the element of list (slbin) to the length (nfull).
<code>extend_hex(slhex, nfull)</code>	Extend the element of list (slhex) to the length (nfull).
<code>extend_list(slbin, nfull)</code>	Extend the list (slbin) to the length (nfull) the attached element of list is 0.
<code>flt2bin(data, nbit_expo, nbit_frac)</code>	Convert float into binary string list.
<code>hex2bin(data)</code>	Convert hex string list to binary string list.
<code>hex2bin_str(shex)</code>	Convert hex string to binary string.
<code>merge_bin(slbin, nmerge)</code>	Merge binary string list per nmerge value.
<code>qc(v[, nbit])</code>	Quantize value using ceil.
<code>qf(v[, nbit])</code>	Quantize value using floor.
<code>qr(v[, nbit])</code>	Quantize value using round.
<code>reverse_bin(slbin, nreverse)</code>	Reverse binary string list per nreverse value.
<code>split_bin(sbin, nbit)</code>	Split sbins into many segment with the length nbit.

find_max_expo
flt2bin_one
norm_expo
split_expo_mant

bin2hex(data)

Convert binary string list to hex string list.

bin2hex_str(sbin)

Convert binary string to hex string.

byte2hex(bs, nbyte)

Convert byte into hex bs: low byte in the first hex: low byte in the right.

check_dec(idec, nbit, signed=False, name='')

Check whether the data (idec) is in the range range is $[0, 2^{nbit} - 1]$ for unsigned range is $[-2^{nbit-1}, 2^{nbit-1} - 1]$ for signed.

dec2bin(idec, nbit=10, signed=False, name='')

Convert dec array to binary string list.

extend_bin(slbin, nfull)

Extend the element of list (slbin) to the length (nfull).

such as, when

```
slbin = ['10010', '10100'],
nfull = 6
```

extent to

```
['010010', '010100']
```

extend_hex(slhex, nfull)

Extend the element of list (slhex) to the length (nfull).

extend_list(slbin, nfull)

Extend the list (slbin) to the length (nfull) the attached element of list is 0.

such as, when

```
slbin = ['10010', '10100'],
nfull = 4
```

extent it to

```
['10010', '10100', '00000', '00000']
```

find_max_expo(v, expo_min=-1000)

flt2bin(data, nbit_expo, nbit_frac)

Convert float into binary string list.

flt2bin_one(v, nbit_expo, nbit_frac)
hex2bin(data)
Convert hex string list to binary string list.
hex2bin_str(shex)
Convert hex string to binary string.
merge_bin(slbin, nmerge)
Merge binary string list per nmerge value.
norm_expo(v, nbit_frac=20, expo_min=-1000)
qc(v, nbit: `int` = 14)
Quantize value using ceil.
qf(v, nbit: `int` = 14)
Quantize value using floor.
qr(v, nbit: `int` = 14)
Quantize value using round.
reverse_bin(slbin, nreverse)
Reverse binary string list per nreverse value.
split_bin(sbin, nbit: `int`)
Split sbin into many segment with the length nbit.
split_expo_mant(v, min=-1000)

deepmd.nvnmd.utils.fio module

class deepmd.nvnmd.utils.fio.Fio
Bases: `object`
Basic class for FIO.

Methods

<code>create_file_path</code>
<code>exits</code>
<code>get_file_list</code>
<code>is_file</code>
<code>is_path</code>
<code>mkdir</code>

create_file_path(file_name='')
exits(file_name='')
get_file_list(path) → `list`
is_file(file_name)

```
is_path(path)
```

```
mkdir(path_name='')
```

```
class deepmd.nvnmd.utils.fio.FioBin
```

```
Bases: object
```

Input and output for binary file.

Methods

<code>load([file_name, default_value])</code>	Load binary file into bytes value.
<code>save(file_name, data)</code>	Save hex string into binary file.

```
load(file_name='', default_value='')
```

Load binary file into bytes value.

```
save(file_name: str, data: List[str])
```

Save hex string into binary file.

```
class deepmd.nvnmd.utils.fio.FioDic
```

```
Bases: object
```

Input and output for dict class data the file can be .json or .npz file containing a dictionary.

Methods

<code>update(jdata, jdata_o)</code>	Update key-value pair is key in jdata_o.keys().
-------------------------------------	---

get
load
save

```
get(jdata, key, default_value)
```

```
load(file_name='', default_value={})
```

```
save(file_name='', dic={})
```

```
update(jdata, jdata_o)
```

Update key-value pair is key in jdata_o.keys().

Parameters

jdata

new jdata

jdata_o

origin jdata

```
class deepmd.nvnmd.utils.fio.FioJsonDic
```

```
Bases: object
```

Input and output for .json file containing dictionary.

Methods

<code>load([file_name, default_value])</code>	Load .json file into dict.
<code>save([file_name, dic])</code>	Save dict into .json file.

`load(file_name="", default_value={})`

Load .json file into dict.

`save(file_name="", dic={})`

Save dict into .json file.

`class deepmd.nvnmd.utils.fio.FioNpyDic`

Bases: `object`

Input and output for .npz file containing dictionary.

Methods

load
save

`load(file_name="", default_value={})`

`save(file_name="", dic={})`

`class deepmd.nvnmd.utils.fio.FioTxt`

Bases: `object`

Input and output for .txt file with string.

Methods

<code>load([file_name, default_value])</code>	Load .txt file into string list.
<code>save([file_name, data])</code>	Save string list into .txt file.

`load(file_name="", default_value=[])`

Load .txt file into string list.

`save(file_name: str = "", data: list = [])`

Save string list into .txt file.

deepmd.nvnmd.utils.network module

`deepmd.nvnmd.utils.network.get_sess()`

`deepmd.nvnmd.utils.network.matmul2_qq(a, b, nbit)`

Quantized matmul operation for 2d tensor. a and b is input tensor, nbit represent quantification precision.

`deepmd.nvnmd.utils.network.matmul3_qq(a, b, nbit)`

Quantized matmul operation for 3d tensor. a and b is input tensor, nbit represent quantification precision.

`deepmd.nvnmd.utils.network.one_layer(inputs, outputs_size, activation_fn=<function tanh>, precision=tf.float64, stddev=1.0, bavg=0.0, name='linear', reuse=None, seed=None, use_timestep=False, trainable=True, useBN=False, uniform_seed=False, initial_variables=None, mixed_prec=None, final_layer=False)`

Build one layer with continuous or quantized value. Its weight and bias can be initialed with random or constant value.

`deepmd.nvnmd.utils.network.one_layer_wb(shape, outputs_size, bavg, stddev, precision, trainable, initial_variables, seed, uniform_seed, name)`

`deepmd.nvnmd.utils.network.qf(x, nbit)`

Quantize and floor tensor x with quantification precision nbit.

`deepmd.nvnmd.utils.network.qr(x, nbit)`

Quantize and round tensor x with quantification precision nbit.

`deepmd.nvnmd.utils.network.tanh4(x)`

deepmd.nvnmd.utils.op module

`deepmd.nvnmd.utils.op.map_nvnmd(x, map_y, map_dy, prec, nbit=None)`

Mapping function implemented by numpy.

`deepmd.nvnmd.utils.op.r2s(r, rmin, rmax)`

deepmd.nvnmd.utils.weight module

`deepmd.nvnmd.utils.weight.get_constant_initializer(weights, name)`

Get initial value by name and create a initializer.

`deepmd.nvnmd.utils.weight.get_filter_weight(weights: dict, spe_i: int, spe_j: int, layer_l: int)`

Get weight and bias of embedding network.

Parameters

weights

[dict] weights

spe_i

[int] special order of central atom i 0~ntype-1

spe_j
[int] special order of neighbor atom j 0~ntype-1

layer_l
layer order in embedding network 1~nlayer

`deepmd.nvnmd.utils.weight.get_fitnet_weight(weights: dict, spe_i: int, layer_l: int, nlayer: int = 10)`

Get weight and bias of fitting network.

Parameters

weights
[dict] weights

spe_i
[int] special order of central atom i 0~ntype-1

layer_l
[int] layer order in embedding network 0~nlayer-1

nlayer
[int] number of layers

`deepmd.nvnmd.utils.weight.get_normalize(weights: dict)`

Get normalize parameter (avg and std) of s_{ji} .

`deepmd.nvnmd.utils.weight.get_weight(weights, key)`

Get weight value according to key.

deepmd.op package

This module will house cust Tf OPs after CMake installation.

`deepmd.op.import_ops()`

Import all custom TF ops that are present in this submodule.

Notes

Initially this subdir is unpopulated. CMake will install all the op module python files and shared libs.

deepmd.train package

Submodules

deepmd.train.run_options module

Module taking care of important package constants.

```
class deepmd.train.run_options.RunOptions(init_model: str | None = None, init_frz_model: str | None = None, finetune: str | None = None, restart: str | None = None, log_path: str | None = None, log_level: int = 0, mpi_log: str = 'master')
```

Bases: `object`

Class with info on how to run training (cluster, MPI and GPU config).

Attributes

`gpus`: Optional[List[int]]
 list of GPUs if any are present else None
`is_chief`: bool
 in distributed training it is true for the main MPI process in serial it is always true
`world_size`: int
 total worker count
`my_rank`: int
 index of the MPI task
`nodename`: str
 name of the node
`node_list`:
 [List[str]] the list of nodes of the current mpirun
`my_device`: str
 device type - gpu or cpu

Methods

<code>print_resource_summary()</code>	Print build and current running cluster configuration summary.
---------------------------------------	--

```

gpus: List[int] | None
property is_chief
    Whether my rank is 0.
my_device: str
my_rank: int
nodelist: List[int]
nodename: str
print_resource_summary()
    Print build and current running cluster configuration summary.
world_size: int
  
```

deepmd.train.trainer module

```

class deepmd.train.trainer.DPTrainer(jdata, run_opt, is_compress=False)
    Bases: object
  
```

Methods

<code>save_compressed()</code>	Save the compressed graph.
--------------------------------	----------------------------

<code>build</code>
<code>eval_single_list</code>
<code>get_evaluation_results</code>
<code>get_feed_dict</code>
<code>get_global_step</code>
<code>print_header</code>
<code>print_on_training</code>
<code>save_checkpoint</code>
<code>train</code>
<code>valid_on_the_fly</code>

```

build(data=None, stop_batch=0, origin_type_map=None, suffix='')

static eval_single_list(single_batch_list, loss, sess, get_feed_dict_func, prefix='')

get_evaluation_results(batch_list)

get_feed_dict(batch, is_training)

get_global_step()

static print_header(fp, train_results, valid_results, multi_task_mode=False)

static print_on_training(fp, train_results, valid_results, cur_batch, cur_lr,
                        multi_task_mode=False)

save_checkpoint(cur_batch: int)

save_compressed()
    Save the compressed graph.

train(train_data=None, valid_data=None)

valid_on_the_fly(fp, train_batches, valid_batches, print_header=False)

```

deepmd.utils package

```

class deepmd.utils.DeepmdData(sys_path: str, set_prefix: str = 'set', shuffle_test: bool = True,
                              type_map: List[str] | None = None, optional_type_map: bool = True,
                              modifier=None, trn_all_set: bool = False)

```

Bases: `object`

Class for a data system.

It loads data from hard disk, and maintains the data as a `data_dict`

Parameters

`sys_path`
Path to the data system

`set_prefix`
 Prefix for the directories of different sets

`shuffle_test`
 If the test data are shuffled

`type_map`
 Gives the name of different atom types

`optional_type_map`
 If the `type_map.raw` in each system is optional

`modifier`
 Data modifier that has the method `modify_data`

`trn_all_set`
 Use all sets as training dataset. Otherwise, if the number of sets is more than 1, the last set is left for test.

Methods

<code>add(key, ndof[, atomic, must, high_prec, ...])</code>	Add a data item that to be loaded.
<code>avg(key)</code>	Return the average value of an item.
<code>check_batch_size(batch_size)</code>	Check if the system can get a batch of data with <code>batch_size</code> frames.
<code>check_test_size(test_size)</code>	Check if the system can get a test dataset with <code>test_size</code> frames.
<code>get_atom_type()</code>	Get atom types.
<code>get_batch(batch_size)</code>	Get a batch of data with <code>batch_size</code> frames.
<code>get_data_dict()</code>	Get the <code>data_dict</code> .
<code>get_natoms()</code>	Get number of atoms.
<code>get_natoms_vec(ntypes)</code>	Get number of atoms and number of atoms in different types.
<code>get_ntypes()</code>	Number of atom types in the system.
<code>get_numbatch(batch_size, set_idx)</code>	Get the number of batches in a set.
<code>get_numbatch_set()</code>	Get number of training sets.
<code>get_sys_numbatch(batch_size)</code>	Get the number of batches in the data system.
<code>get_test([ntests])</code>	Get the test data with <code>ntests</code> frames.
<code>get_type_map()</code>	Get the type map.
<code>reduce(key_out, key_in)</code>	Generate a new item from the reduction of another atom.

`reset_get_batch`

`add(key: str, ndof: int, atomic: bool = False, must: bool = False, high_prec: bool = False, type_sel: List[int] | None = None, repeat: int = 1, default: float = 0.0, dtype: dtype | None = None)`

Add a data item that to be loaded.

Parameters

`key`

The key of the item. The corresponding data is stored in `sys_path/set.*/key.npy`

`ndof`
The number of dof

`atomic`
The item is an atomic property. If False, the size of the data should be `nframes x ndof`. If True, the size of data should be `nframes x natoms x ndof`

`must`
The data file `sys_path/set.*/key.npy` must exist. If `must` is False and the data file does not exist, the `data_dict[find_key]` is set to 0.0

`high_prec`
Load the data and store in float64, otherwise in float32

`type_sel`
Select certain type of atoms

`repeat`
The data will be repeated `repeat` times.

`default`
[`float`, `default=0.`] default value of data

`dtype`
[`np.dtype`, `optional`] the dtype of data, overwrites `high_prec` if provided

`avg(key)`

Return the average value of an item.

`check_batch_size(batch_size)`

Check if the system can get a batch of data with `batch_size` frames.

`check_test_size(test_size)`

Check if the system can get a test dataset with `test_size` frames.

`get_atom_type()` → `List[int]`

Get atom types.

`get_batch(batch_size: int)` → `dict`

Get a batch of data with `batch_size` frames. The frames are randomly picked from the data system.

Parameters

`batch_size`
size of the batch

`get_data_dict()` → `dict`

Get the `data_dict`.

`get_natoms()`

Get number of atoms.

`get_natoms_vec(ntypes: int)`

Get number of atoms and number of atoms in different types.

Parameters

`ntypes`
Number of types (may be larger than the actual number of types in the system).

Returns

```

    natoms
    natoms[0]: number of local atoms natoms[1]: total number of atoms held by this
    processor natoms[i]:  $2 \leq i < Ntypes+2$ , number of type i atoms

get_ntypes() → int
    Number of atom types in the system.

get_numb_batch(batch_size: int, set_idx: int) → int
    Get the number of batches in a set.

get_numb_set() → int
    Get number of training sets.

get_sys_numb_batch(batch_size: int) → int
    Get the number of batches in the data system.

get_test(ntests: int = -1) → dict
    Get the test data with ntests frames.

    Parameters
    ntests
        Size of the test data set. If ntests is -1, all test data will be get.

get_type_map() → List[str]
    Get the type map.

reduce(key_out: str, key_in: str)
    Generate a new item from the reduction of another atom.

    Parameters
    key_out
        The name of the reduced item
    key_in
        The name of the data item to be reduced

reset_get_batch()

class deepmd.utils.DeepmdDataSystem(systems: List[str], batch_size: int, test_size: int, rcut: float,
    set_prefix: str = 'set', shuffle_test: bool = True, type_map:
    List[str] | None = None, optional_type_map: bool = True,
    modifier=None, trn_all_set=False, sys_probs=None,
    auto_prob_style='prob_sys_size')

Bases: object
Class for manipulating many data systems.
It is implemented with the help of DeepmdData

```

Methods

<code>add(key, ndof[, atomic, must, high_prec, ...])</code>	Add a data item that to be loaded.
<code>add_dict(adict)</code>	Add items to the data system by a dict.
<code>get_batch([sys_idx])</code>	Get a batch of data from the data systems.
<code>get_batch_mixed()</code>	Get a batch of data from the data systems in the mixed way.
<code>get_batch_size()</code>	Get the batch size.
<code>get_batch_standard([sys_idx])</code>	Get a batch of data from the data systems in the standard way.
<code>get_nbatches()</code>	Get the total number of batches.
<code>get_nsystems()</code>	Get the number of data systems.
<code>get_ntypes()</code>	Get the number of types.
<code>get_sys(idx)</code>	Get a certain data system.
<code>get_sys_ntest([sys_idx])</code>	Get number of tests for the currently selected system, or one defined by sys_idx.
<code>get_test([sys_idx, n_test])</code>	Get test data from the the data systems.
<code>get_type_map()</code>	Get the type map.
<code>reduce(key_out, key_in)</code>	Generate a new item from the reduction of another atom.

<code>compute_energy_shift</code>
<code>get_data_dict</code>
<code>print_summary</code>
<code>set_sys_probs</code>

add(key: `str`, ndof: `int`, atomic: `bool` = False, must: `bool` = False, high_prec: `bool` = False, type_sel: `List[int] | None` = None, repeat: `int` = 1, default: `float` = 0.0)

Add a data item that to be loaded.

Parameters

key

The key of the item. The corresponding data is stored in `sys_path/set.*/key.npy`

ndof

The number of dof

atomic

The item is an atomic property. If False, the size of the data should be `nframes x ndof` If True, the size of data should be `nframes x natoms x ndof`

must

The data file `sys_path/set.*/key.npy` must exist. If must is False and the data file does not exist, the `data_dict[find_key]` is set to 0.0

high_prec

Load the data and store in float64, otherwise in float32

type_sel

Select certain type of atoms

repeat

The data will be repeated repeat times.

default, default=0.
Default value of data

add_dict(adict: dict) → None

Add items to the data system by a dict. adict should have items like .. code-block:: python.

```
adict[key] = {
    "ndof": ndof, "atomic": atomic, "must": must, "high_prec": high_prec, "type_sel":
    type_sel, "repeat": repeat,
}
```

For the explanation of the keys see add

compute_energy_shift(rcond=0.001, key='energy')

get_batch(sys_idx: int | None = None) → dict

Get a batch of data from the data systems.

Parameters

sys_idx
[int] The index of system from which the batch is get. If sys_idx is not None, sys_probs and auto_prob_style are ignored If sys_idx is None, automatically determine the system according to sys_probs or auto_prob_style, see the following. This option does not work for mixed systems.

Returns

dict
The batch data

get_batch_mixed() → dict

Get a batch of data from the data systems in the mixed way.

Returns

dict
The batch data

get_batch_size() → int

Get the batch size.

get_batch_standard(sys_idx: int | None = None) → dict

Get a batch of data from the data systems in the standard way.

Parameters

sys_idx
[int] The index of system from which the batch is get. If sys_idx is not None, sys_probs and auto_prob_style are ignored If sys_idx is None, automatically determine the system according to sys_probs or auto_prob_style, see the following.

Returns

dict
The batch data

get_data_dict(ii: int = 0) → dict

get_nbatch() → int

Get the total number of batches.

`get_nsystems()` → `int`

Get the number of data systems.

`get_ntypes()` → `int`

Get the number of types.

`get_sys(idx: int)` → `DeepmdData`

Get a certain data system.

`get_sys_ntest(sys_idx=None)`

Get number of tests for the currently selected system, or one defined by `sys_idx`.

`get_test(sys_idx: int | None = None, n_test: int = -1)`

Get test data from the the data systems.

Parameters

`sys_idx`

The test dat of system with index `sys_idx` will be returned. If is `None`, the currently selected system will be returned.

`n_test`

Number of test data. If set to -1 all test data will be get.

`get_type_map()` → `List[str]`

Get the type map.

`print_summary(name)`

`reduce(key_out, key_in)`

Generate a new item from the reduction of another atom.

Parameters

`key_out`

The name of the reduced item

`key_in`

The name of the data item to be reduced

`set_sys_probs(sys_probs=None, auto_prob_style: str = 'prob_sys_size')`

`class deepmd.utils.LearningRateExp(start_lr: float, stop_lr: float = 5e-08, decay_steps: int = 5000, decay_rate: float = 0.95)`

Bases: `object`

The exponentially decaying learning rate.

The learning rate at step t is given by

$$\alpha(t) = \alpha_0 \lambda^{t/\tau}$$

where α is the learning rate, α_0 is the starting learning rate, λ is the decay rate, and τ is the decay steps.

Parameters

`start_lr`

Starting learning rate α_0

`stop_lr`

Stop learning rate α_1

`decay_steps`
Learning rate decay every this number of steps τ

`decay_rate`
The decay rate λ . If `stop_step` is provided in `build`, then it will be determined automatically and overwritten.

Methods

<code>build(global_step[, stop_step])</code>	Build the learning rate.
<code>start_lr()</code>	Get the start lr.
<code>value(step)</code>	Get the lr at a certain step.

`build(global_step: Tensor, stop_step: int | None = None) → Tensor`

Build the learning rate.

Parameters

`global_step`

The tf Tensor providing the global training step

`stop_step`

The stop step. If provided, the `decay_rate` will be determined automatically and overwritten.

Returns

`learning_rate`

The learning rate

`start_lr() → float`

Get the start lr.

`value(step: int) → float`

Get the lr at a certain step.

`class deepmd.utils.PairTab(filename: str)`

Bases: `object`

Parameters

`filename`

File name for the short-range tabulated potential. The table is a text data file with $(N_t + 1) * N_t / 2 + 1$ columns. The first column is the distance between atoms. The second to the last columns are energies for pairs of certain types. For example we have two atom types, 0 and 1. The columns from 2nd to 4th are for 0-0, 0-1 and 1-1 correspondingly.

Methods

<code>get()</code>	Get the serialized table.
<code>reinit(filename)</code>	Initialize the tabulated interaction.

`get()` → `Tuple[array, array]`

Get the serialized table.

`reinit(filename: str) → None`

Initialize the tabulated interaction.

Parameters

filename

File name for the short-range tabulated potential. The table is a text data file with $(N_t + 1) * N_t / 2 + 1$ columns. The first column is the distance between atoms. The second to the last columns are energies for pairs of certain types. For example we have two atom types, 0 and 1. The columns from 2nd to 4th are for 0-0, 0-1 and 1-1 correspondingly.

`class deepmd.utils.Plugin`

Bases: `object`

A class to register and restore plugins.

Examples

```
>>> plugin = Plugin()
>>> @plugin.register("xx")
def xxx():
    pass
>>> print(plugin.plugins['xx'])
```

Attributes

plugins

`[Dict[str, object]]` plugins

Methods

<code>get_plugin(key)</code>	Visit a plugin by key.
<code>register(key)</code>	Register a plugin.

`get_plugin(key) → object`

Visit a plugin by key.

Parameters

key

`[str]` key of the plugin

Returns

```

    object
    the plugin
register(key: str) → Callable[[object], object]
    Register a plugin.
    Parameters
        key
            [str] key of the plugin
    Returns
        Callable[[object], object]
            decorator
class deepmd.utils.PluginVariant(*args, **kwargs)
    Bases: object
    A class to remove type from input arguments.

```

Submodules

deepmd.utils.argcheck module

```

class deepmd.utils.argcheck.ArgsPlugin
    Bases: object

```

Methods

<code>get_all_argument(exclude_hybrid)</code>	Get all arguments.
<code>register(name[, alias])</code>	Register a descriptor argument plugin.

```

get_all_argument(exclude_hybrid: bool = False) → List[Argument]
    Get all arguments.
    Parameters
        exclude_hybrid
            [bool] exclude hybrid descriptor to prevent circular calls
    Returns
        List[Argument]
            all arguments
register(name: str, alias: List[str] | None = None) → Callable[[], List[Argument]]
    Register a descriptor argument plugin.
    Parameters
        name
            [str] the name of a descriptor
        alias
            [List[str], optional] the list of aliases of this descriptor

```

Returns

`Callable[[], List[Argument]]`
the registered descriptor argument method

Examples

```
>>> some_plugin = ArgsPlugin()
>>> @some_plugin.register("some_descrpt")
def descrpt_some_descrpt_args():
    return []
```

```
deepmd.utils.argcheck.descrpt_hybrid_args()
deepmd.utils.argcheck.descrpt_local_frame_args()
deepmd.utils.argcheck.descrpt_se_a_args()
deepmd.utils.argcheck.descrpt_se_a_mask_args()
deepmd.utils.argcheck.descrpt_se_a_tpe_args()
deepmd.utils.argcheck.descrpt_se_atten_args()
deepmd.utils.argcheck.descrpt_se_r_args()
deepmd.utils.argcheck.descrpt_se_t_args()
deepmd.utils.argcheck.descrpt_variant_type_args(exclude_hybrid: bool = False) → Variant
deepmd.utils.argcheck.fitting_dipole()
deepmd.utils.argcheck.fitting_ener()
deepmd.utils.argcheck.fitting_polar()
deepmd.utils.argcheck.fitting_variant_type_args()
deepmd.utils.argcheck.gen_args(**kwargs)
deepmd.utils.argcheck.gen_doc(*, make_anchor=True, make_link=True, **kwargs)
deepmd.utils.argcheck.gen_json(**kwargs)
deepmd.utils.argcheck.learning_rate_args()
deepmd.utils.argcheck.learning_rate_exp()
deepmd.utils.argcheck.learning_rate_variant_type_args()
deepmd.utils.argcheck.limit_pref(item)
deepmd.utils.argcheck.list_to_doc(xx)
deepmd.utils.argcheck.loss_args()
deepmd.utils.argcheck.loss_dict_args()
deepmd.utils.argcheck.loss_ener()
```

```

deepmd.utils.argcheck.loss_tensor()
deepmd.utils.argcheck.loss_variant_type_args()
deepmd.utils.argcheck.make_index(keys)
deepmd.utils.argcheck.make_link(content, ref_key)
deepmd.utils.argcheck.mixed_precision_args()
deepmd.utils.argcheck.model_args()
deepmd.utils.argcheck.model_compression()
deepmd.utils.argcheck.model_compression_type_args()
deepmd.utils.argcheck.modifier_dipole_charge()
deepmd.utils.argcheck.modifier_variant_type_args()
deepmd.utils.argcheck.normalize(data)
deepmd.utils.argcheck.normalize_data_dict(data_dict)
deepmd.utils.argcheck.normalize_fitting_net_dict(fitting_net_dict)
deepmd.utils.argcheck.normalize_fitting_weight(fitting_keys, data_keys, fitting_weight=None)
deepmd.utils.argcheck.normalize_hybrid_list(hy_list)
deepmd.utils.argcheck.normalize_loss_dict(fitting_keys, loss_dict)
deepmd.utils.argcheck.normalize_multi_task(data)
deepmd.utils.argcheck.start_pref(item)
deepmd.utils.argcheck.training_args()
deepmd.utils.argcheck.training_data_args()
deepmd.utils.argcheck.type_embedding_args()
deepmd.utils.argcheck.validation_data_args()

```

deepmd.utils.batch_size module

```
class deepmd.utils.batch_size.AutoBatchSize(initial_batch_size: int = 1024, factor: float = 2.0)
```

Bases: `object`

This class allows DeePMD-kit to automatically decide the maximum batch size that will not cause an OOM error.

Parameters

`initial_batch_size`

[`int`, default: 1024] initial batch size (number of total atoms) when DP_INFER_BATCH_SIZE is not set

`factor`

[`float`, default: 2.] increased factor

Notes

In some CPU environments, the program may be directly killed when OOM. In this case, by default the batch size will not be increased for CPUs. The environment variable `DP_INFER_BATCH_SIZE` can be set as the batch size.

In other cases, we assume all OOM error will raise `OutOfMemoryError`.

Attributes

`current_batch_size`
`[int]` current batch size (number of total atoms)

`maximum_working_batch_size`
`[int]` maximum working batch size

`minimal_not_working_batch_size`
`[int]` minimal not working batch size

Methods

<code>execute(callable, start_index, natoms)</code>	Excuate a method with given batch size.
<code>execute_all(callable, total_size, natoms, ...)</code>	Excuate a method with all given data.

execute(callable: `Callable`, start_index: `int`, natoms: `int`) → `Tuple[int, tuple]`

Excuate a method with given batch size.

Parameters

`callable`
`[Callable]` The method should accept the batch size and start_index as parameters, and returns executed batch size and data.

`start_index`
`[int]` start index

`natoms`
`[int]` natoms

Returns

`int`
 executed batch size * number of atoms

`tuple`
 result from callable, None if failing to execute

Raises

OutOfMemoryError
 OOM when batch size is 1

execute_all(callable: `Callable`, total_size: `int`, natoms: `int`, *args, **kwargs) → `Tuple[ndarray]`

Excuate a method with all given data.

Parameters

`callable`
`[Callable]` The method should accept *args and **kwargs as input and return the similiar array.

total_size
 [int] Total size

natoms
 [int] The number of atoms

*args
 Variable length argument list.

**kwargs
 If 2D np.ndarray, assume the first axis is batch; otherwise do nothing.

deepmd.utils.compat module

Module providing compatibility between 0.x.x and 1.x.x input versions.

`deepmd.utils.compat.convert_input_v0_v1(jdata: Dict[str, Any], warning: bool = True, dump: str | Path | None = None) → Dict[str, Any]`

Convert input from v0 format to v1.

Parameters

jdata
 [Dict[str, Any]] loaded json/yaml file

warning
 [bool, optional] whether to show deprecation warning, by default True

dump
 [Optional[Union[str, Path]], optional] whether to dump converted file, by default None

Returns

Dict[str, Any]
 converted output

`deepmd.utils.compat.convert_input_v1_v2(jdata: Dict[str, Any], warning: bool = True, dump: str | Path | None = None) → Dict[str, Any]`

`deepmd.utils.compat.deprecate_numb_test(jdata: Dict[str, Any], warning: bool = True, dump: str | Path | None = None) → Dict[str, Any]`

Deprecate numb_test since v2.1. It has taken no effect since v2.0.

See #1243.

Parameters

jdata
 [Dict[str, Any]] loaded json/yaml file

warning
 [bool, optional] whether to show deprecation warning, by default True

dump
 [Optional[Union[str, Path]], optional] whether to dump converted file, by default None

Returns

Dict[str, Any]
 converted output

```
deepmd.utils.compat.remove_decay_rate(jdata: Dict[str, Any])
```

Convert decay_rate to stop_lr.

Parameters

jdata
[Dict[str, Any]] input data

```
deepmd.utils.compat.update_deepmd_input(jdata: Dict[str, Any], warning: bool = True, dump: str |  
Path | None = None) → Dict[str, Any]
```

deepmd.utils.convert module

```
deepmd.utils.convert.convert_012_to_21(input_model: str, output_model: str)
```

Convert DP 0.12 graph to 2.1 graph.

Parameters

input_model
[str] filename of the input graph

output_model
[str] filename of the output graph

```
deepmd.utils.convert.convert_10_to_21(input_model: str, output_model: str)
```

Convert DP 1.0 graph to 2.1 graph.

Parameters

input_model
[str] filename of the input graph

output_model
[str] filename of the output graph

```
deepmd.utils.convert.convert_12_to_21(input_model: str, output_model: str)
```

Convert DP 1.2 graph to 2.1 graph.

Parameters

input_model
[str] filename of the input graph

output_model
[str] filename of the output graph

```
deepmd.utils.convert.convert_13_to_21(input_model: str, output_model: str)
```

Convert DP 1.3 graph to 2.1 graph.

Parameters

input_model
[str] filename of the input graph

output_model
[str] filename of the output graph

```
deepmd.utils.convert.convert_20_to_21(input_model: str, output_model: str)
```

Convert DP 2.0 graph to 2.1 graph.

Parameters

```

    input_model
        [str] filename of the input graph
    output_model
        [str] filename of the output graph
deepmd.utils.convert.convert_dp012_to_dp10(file: str)
    Convert DP 0.12 graph text to 1.0 graph text.
    Parameters
        file
            [str] filename of the graph text
deepmd.utils.convert.convert_dp10_to_dp11(file: str)
    Convert DP 1.0 graph text to 1.1 graph text.
    Parameters
        file
            [str] filename of the graph text
deepmd.utils.convert.convert_dp12_to_dp13(file: str)
    Convert DP 1.2 graph text to 1.3 graph text.
    Parameters
        file
            [str] filename of the graph text
deepmd.utils.convert.convert_dp13_to_dp20(fname: str)
    Convert DP 1.3 graph text to 2.0 graph text.
    Parameters
        fname
            [str] filename of the graph text
deepmd.utils.convert.convert_dp20_to_dp21(fname: str)
deepmd.utils.convert.convert_pb_to_pbtxt(pbfile: str, pbtxtfile: str)
    Convert DP graph to graph text.
    Parameters
        pbfile
            [str] filename of the input graph
        pbtxtfile
            [str] filename of the output graph text
deepmd.utils.convert.convert_pbtxt_to_pb(pbtxtfile: str, pbfile: str)
    Convert DP graph text to graph.
    Parameters
        pbtxtfile
            [str] filename of the input graph text
        pbfile
            [str] filename of the output graph

```

```
deepmd.utils.convert.convert_to_21(input_model: str, output_model: str)
```

Convert DP graph to 2.1 graph.

Parameters

input_model
[str] filename of the input graph

output_model
[str] filename of the output graph

```
deepmd.utils.convert.detect_model_version(input_model: str)
```

Detect DP graph version.

Parameters

input_model
[str] filename of the input graph

deepmd.utils.data module

```
class deepmd.utils.data.DeepmdData(sys_path: str, set_prefix: str = 'set', shuffle_test: bool = True,  
                                   type_map: List[str] | None = None, optional_type_map: bool =  
                                   True, modifier=None, trn_all_set: bool = False)
```

Bases: `object`

Class for a data system.

It loads data from hard disk, and maintains the data as a `data_dict`

Parameters

sys_path
Path to the data system

set_prefix
Prefix for the directories of different sets

shuffle_test
If the test data are shuffled

type_map
Gives the name of different atom types

optional_type_map
If the `type_map.raw` in each system is optional

modifier
Data modifier that has the method `modify_data`

trn_all_set
Use all sets as training dataset. Otherwise, if the number of sets is more than 1, the last set is left for test.

Methods

<code>add(key, ndof[, atomic, must, high_prec, ...])</code>	Add a data item that to be loaded.
<code>avg(key)</code>	Return the average value of an item.
<code>check_batch_size(batch_size)</code>	Check if the system can get a batch of data with <code>batch_size</code> frames.
<code>check_test_size(test_size)</code>	Check if the system can get a test dataset with <code>test_size</code> frames.
<code>get_atom_type()</code>	Get atom types.
<code>get_batch(batch_size)</code>	Get a batch of data with <code>batch_size</code> frames.
<code>get_data_dict()</code>	Get the <code>data_dict</code> .
<code>get_natoms()</code>	Get number of atoms.
<code>get_natoms_vec(ntypes)</code>	Get number of atoms and number of atoms in different types.
<code>get_ntypes()</code>	Number of atom types in the system.
<code>get_num_batch(batch_size, set_idx)</code>	Get the number of batches in a set.
<code>get_num_set()</code>	Get number of training sets.
<code>get_sys_num_batch(batch_size)</code>	Get the number of batches in the data system.
<code>get_test([ntests])</code>	Get the test data with <code>ntests</code> frames.
<code>get_type_map()</code>	Get the type map.
<code>reduce(key_out, key_in)</code>	Generate a new item from the reduction of another atom.

`reset_get_batch`

`add(key: str, ndof: int, atomic: bool = False, must: bool = False, high_prec: bool = False, type_sel: List[int] | None = None, repeat: int = 1, default: float = 0.0, dtype: dtype | None = None)`

Add a data item that to be loaded.

Parameters

`key`

The key of the item. The corresponding data is stored in `sys_path/set.*/key.npy`

`ndof`

The number of dof

`atomic`

The item is an atomic property. If False, the size of the data should be `nframes x ndof` If True, the size of data should be `nframes x natoms x ndof`

`must`

The data file `sys_path/set.*/key.npy` must exist. If `must` is False and the data file does not exist, the `data_dict[find_key]` is set to 0.0

`high_prec`

Load the data and store in float64, otherwise in float32

`type_sel`

Select certain type of atoms

`repeat`

The data will be repeated `repeat` times.

default
[float, default=0.] default value of data

dtype
[np.dtype, optional] the dtype of data, overwrites high_prec if provided

avg(key)
Return the average value of an item.

check_batch_size(batch_size)
Check if the system can get a batch of data with batch_size frames.

check_test_size(test_size)
Check if the system can get a test dataset with test_size frames.

get_atom_type() → List[int]
Get atom types.

get_batch(batch_size: int) → dict
Get a batch of data with batch_size frames. The frames are randomly picked from the data system.

Parameters

batch_size
size of the batch

get_data_dict() → dict
Get the data_dict.

get_natoms()
Get number of atoms.

get_natoms_vec(ntypes: int)
Get number of atoms and number of atoms in different types.

Parameters

ntypes
Number of types (may be larger than the actual number of types in the system).

Returns

natoms
natoms[0]: number of local atoms natoms[1]: total number of atoms held by this processor natoms[i]: $2 \leq i < \text{Ntypes} + 2$, number of type i atoms

get_ntypes() → int
Number of atom types in the system.

get_numb_batch(batch_size: int, set_idx: int) → int
Get the number of batches in a set.

get_numb_set() → int
Get number of training sets.

get_sys_numb_batch(batch_size: int) → int
Get the number of batches in the data system.

get_test(ntests: `int` = -1) → `dict`

Get the test data with ntests frames.

Parameters

ntests

Size of the test data set. If ntests is -1, all test data will be get.

get_type_map() → `List[str]`

Get the type map.

reduce(key_out: `str`, key_in: `str`)

Generate a new item from the reduction of another atom.

Parameters

key_out

The name of the reduced item

key_in

The name of the data item to be reduced

reset_get_batch()

deepmd.utils.data_system module

```
class deepmd.utils.data_system.DeepmdDataSystem(systems: List[str], batch_size: int, test_size: int,
rcut: float, set_prefix: str = 'set', shuffle_test:
bool = True, type_map: List[str] | None = None,
optional_type_map: bool = True, modifier=None,
trn_all_set=False, sys_probs=None,
auto_prob_style='prob_sys_size')
```

Bases: `object`

Class for manipulating many data systems.

It is implemented with the help of DeepmdData

Methods

<code>add(key, ndof[, atomic, must, high_prec, ...])</code>	Add a data item that to be loaded.
<code>add_dict(adict)</code>	Add items to the data system by a dict.
<code>get_batch([sys_idx])</code>	Get a batch of data from the data systems.
<code>get_batch_mixed()</code>	Get a batch of data from the data systems in the mixed way.
<code>get_batch_size()</code>	Get the batch size.
<code>get_batch_standard([sys_idx])</code>	Get a batch of data from the data systems in the standard way.
<code>get_nbatches()</code>	Get the total number of batches.
<code>get_nsystems()</code>	Get the number of data systems.
<code>get_ntypes()</code>	Get the number of types.
<code>get_sys(idx)</code>	Get a certain data system.
<code>get_sys_ntest([sys_idx])</code>	Get number of tests for the currently selected system, or one defined by sys_idx.
<code>get_test([sys_idx, n_test])</code>	Get test data from the the data systems.
<code>get_type_map()</code>	Get the type map.
<code>reduce(key_out, key_in)</code>	Generate a new item from the reduction of another atom.

<code>compute_energy_shift</code>
<code>get_data_dict</code>
<code>print_summary</code>
<code>set_sys_probs</code>

add(key: str, ndof: int, atomic: bool = False, must: bool = False, high_prec: bool = False, type_sel: List[int] | None = None, repeat: int = 1, default: float = 0.0)

Add a data item that to be loaded.

Parameters

key

The key of the item. The corresponding data is stored in sys_path/set.*/key.npy

ndof

The number of dof

atomic

The item is an atomic property. If False, the size of the data should be nframes x ndof If True, the size of data should be nframes x natoms x ndof

must

The data file sys_path/set.*/key.npy must exist. If must is False and the data file does not exist, the data_dict[find_key] is set to 0.0

high_prec

Load the data and store in float64, otherwise in float32

type_sel

Select certain type of atoms

repeat

The data will be repeated repeat times.

default, default=0.
Default value of data

add_dict(adict: dict) → None

Add items to the data system by a dict. adict should have items like .. code-block:: python.

```
adict[key] = {
    "ndof": ndof, "atomic": atomic, "must": must, "high_prec": high_prec, "type_sel":
    type_sel, "repeat": repeat,
}
```

For the explanation of the keys see add

compute_energy_shift(rcond=0.001, key='energy')

get_batch(sys_idx: int | None = None) → dict

Get a batch of data from the data systems.

Parameters

sys_idx
[int] The index of system from which the batch is get. If sys_idx is not None, sys_probs and auto_prob_style are ignored If sys_idx is None, automatically determine the system according to sys_probs or auto_prob_style, see the following. This option does not work for mixed systems.

Returns

dict
The batch data

get_batch_mixed() → dict

Get a batch of data from the data systems in the mixed way.

Returns

dict
The batch data

get_batch_size() → int

Get the batch size.

get_batch_standard(sys_idx: int | None = None) → dict

Get a batch of data from the data systems in the standard way.

Parameters

sys_idx
[int] The index of system from which the batch is get. If sys_idx is not None, sys_probs and auto_prob_style are ignored If sys_idx is None, automatically determine the system according to sys_probs or auto_prob_style, see the following.

Returns

dict
The batch data

get_data_dict(ii: int = 0) → dict

get_nbatch() → int

Get the total number of batches.

`get_nsystems()` → `int`

Get the number of data systems.

`get_ntypes()` → `int`

Get the number of types.

`get_sys(idx: int)` → `DeepmdData`

Get a certain data system.

`get_sys_ntest(sys_idx=None)`

Get number of tests for the currently selected system, or one defined by `sys_idx`.

`get_test(sys_idx: int | None = None, n_test: int = -1)`

Get test data from the the data systems.

Parameters

`sys_idx`

The test dat of system with index `sys_idx` will be returned. If is `None`, the currently selected system will be returned.

`n_test`

Number of test data. If set to -1 all test data will be get.

`get_type_map()` → `List[str]`

Get the type map.

`print_summary(name)`

`reduce(key_out, key_in)`

Generate a new item from the reduction of another atom.

Parameters

`key_out`

The name of the reduced item

`key_in`

The name of the data item to be reduced

`set_sys_probs(sys_probs=None, auto_prob_style: str = 'prob_sys_size')`

deepmd.utils.errors module

`exception deepmd.utils.errors.GraphTooLargeError`

Bases: `Exception`

The graph is too large, exceeding protobuf's hard limit of 2GB.

`exception deepmd.utils.errors.GraphWithoutTensorError`

Bases: `Exception`

`exception deepmd.utils.errors.OutOfMemoryError`

Bases: `Exception`

This error is caused by out-of-memory (OOM).

deepmd.utils.finetune module

`deepmd.utils.finetune.replace_model_params_with_pretrained_model(jdata: Dict[str, Any], pretrained_model: str)`

Replace the model params in input script according to pretrained model.

Parameters

`jdata`
[Dict[str, Any]] input script

`pretrained_model`
[str] filename of the pretrained model

deepmd.utils.graph module

`deepmd.utils.graph.get_attention_layer_nodes_from_graph_def(graph_def: GraphDef, suffix: str = "") → Dict`

Get the attention layer nodes with the given tf.GraphDef object.

Parameters

`graph_def`
The input tf.GraphDef object

`suffix`
[str, optional] The scope suffix

Returns

Dict
The attention layer nodes within the given tf.GraphDef object

`deepmd.utils.graph.get_attention_layer_variables_from_graph_def(graph_def: GraphDef, suffix: str = "") → Dict`

Get the attention layer variables with the given tf.GraphDef object.

Parameters

`graph_def`
[tf.GraphDef] The input tf.GraphDef object

`suffix`
[str, optional] The suffix of the scope

Returns

Dict
The attention layer variables within the given tf.GraphDef object

`deepmd.utils.graph.get_embedding_net_nodes(model_file: str, suffix: str = "") → Dict`

Get the embedding net nodes with the given frozen model(model_file).

Parameters

`model_file`
The input frozen model path

`suffix`
[str, optional] The suffix of the scope

Returns

Dict

The embedding net nodes with the given frozen model

`deepmd.utils.graph.get_embedding_net_nodes_from_graph_def`(`graph_def`: `GraphDef`, `suffix`: `str` = "")
→ **Dict**

Get the embedding net nodes with the given `tf.GraphDef` object.

Parameters

`graph_def`

The input `tf.GraphDef` object

`suffix`

[`str`, `optional`] The scope suffix

Returns

Dict

The embedding net nodes within the given `tf.GraphDef` object

`deepmd.utils.graph.get_embedding_net_variables`(`model_file`: `str`, `suffix`: `str` = "") → **Dict**

Get the embedding net variables with the given frozen model(`model_file`).

Parameters

`model_file`

The input frozen model path

`suffix`

[`str`, `optional`] The suffix of the scope

Returns

Dict

The embedding net variables within the given frozen model

`deepmd.utils.graph.get_embedding_net_variables_from_graph_def`(`graph_def`: `GraphDef`, `suffix`: `str` = "") → **Dict**

Get the embedding net variables with the given `tf.GraphDef` object.

Parameters

`graph_def`

The input `tf.GraphDef` object

`suffix`

[`str`, `optional`] The suffix of the scope

Returns

Dict

The embedding net variables within the given `tf.GraphDef` object

`deepmd.utils.graph.get_fitting_net_nodes`(`model_file`: `str`) → **Dict**

Get the fitting net nodes with the given frozen model(`model_file`).

Parameters

`model_file`

The input frozen model path

Returns

Dict

The fitting net nodes with the given frozen model

```
deepmd.utils.graph.get_fitting_net_nodes_from_graph_def(graph_def: GraphDef, suffix: str = "")
                                                    → Dict
```

Get the fitting net nodes with the given tf.GraphDef object.

Parameters

graph_def

The input tf.GraphDef object

suffix

suffix of the scope

Returns

Dict

The fitting net nodes within the given tf.GraphDef object

```
deepmd.utils.graph.get_fitting_net_variables(model_file: str, suffix: str = "") → Dict
```

Get the fitting net variables with the given frozen model(model_file).

Parameters

model_file

The input frozen model path

suffix

suffix of the scope

Returns

Dict

The fitting net variables within the given frozen model

```
deepmd.utils.graph.get_fitting_net_variables_from_graph_def(graph_def: GraphDef, suffix: str =
                                                            "") → Dict
```

Get the fitting net variables with the given tf.GraphDef object.

Parameters

graph_def

The input tf.GraphDef object

suffix

suffix of the scope

Returns

Dict

The fitting net variables within the given tf.GraphDef object

```
deepmd.utils.graph.get_pattern_nodes_from_graph_def(graph_def: GraphDef, pattern: str) → Dict
```

Get the pattern nodes with the given tf.GraphDef object.

Parameters

graph_def

The input tf.GraphDef object

pattern

The node pattern within the graph_def

Returns

Dict

The fitting net nodes within the given `tf.GraphDef` object

`deepmd.utils.graph.get_tensor_by_name(model_file: str, tensor_name: str) → Tensor`

Load tensor value from the frozen model(`model_file`).

Parameters

`model_file`

[`str`] The input frozen model path

`tensor_name`

[`str`] Indicates which tensor which will be loaded from the frozen model

Returns

tf.Tensor

The tensor which was loaded from the frozen model

Raises

GraphWithoutTensorError

Whether the `tensor_name` is within the frozen model

`deepmd.utils.graph.get_tensor_by_name_from_graph(graph: Graph, tensor_name: str) → Tensor`

Load tensor value from the given `tf.Graph` object.

Parameters

`graph`

[**tf.Graph**] The input TensorFlow graph

`tensor_name`

[`str`] Indicates which tensor which will be loaded from the frozen model

Returns

tf.Tensor

The tensor which was loaded from the frozen model

Raises

GraphWithoutTensorError

Whether the `tensor_name` is within the frozen model

`deepmd.utils.graph.get_tensor_by_type(node, data_type: dtype) → Tensor`

Get the tensor value within the given node according to the input `data_type`.

Parameters

`node`

The given tensorflow graph node

`data_type`

The data type of the node

Returns

tf.Tensor

The tensor value of the given node

`deepmd.utils.graph.get_type_embedding_net_nodes_from_graph_def`(graph_def: GraphDef, suffix: str = "") → Dict

Get the type embedding net nodes with the given tf.GraphDef object.

Parameters

graph_def
The input tf.GraphDef object

suffix
[str, optional] The scope suffix

Returns

Dict
The type embedding net nodes within the given tf.GraphDef object

`deepmd.utils.graph.get_type_embedding_net_variables_from_graph_def`(graph_def: GraphDef, suffix: str = "") → Dict

Get the type embedding net variables with the given tf.GraphDef object.

Parameters

graph_def
[tf.GraphDef] The input tf.GraphDef object

suffix
[str, optional] The suffix of the scope

Returns

Dict
The embedding net variables within the given tf.GraphDef object

`deepmd.utils.graph.load_graph_def`(model_file: str) → Tuple[Graph, GraphDef]

Load graph as well as the graph_def from the frozen model(model_file).

Parameters

model_file
[str] The input frozen model path

Returns

tf.Graph
The graph loaded from the frozen model

tf.GraphDef
The graph_def loaded from the frozen model

deepmd.utils.learning_rate module

`class deepmd.utils.learning_rate.LearningRateExp`(start_lr: float, stop_lr: float = 5e-08, decay_steps: int = 5000, decay_rate: float = 0.95)

Bases: object

The exponentially decaying learning rate.

The learning rate at step t is given by

$$\alpha(t) = \alpha_0 \lambda^{t/\tau}$$

where α is the learning rate, α_0 is the starting learning rate, λ is the decay rate, and τ is the decay steps.

Parameters

- `start_lr`
Starting learning rate α_0
- `stop_lr`
Stop learning rate α_1
- `decay_steps`
Learning rate decay every this number of steps τ
- `decay_rate`
The decay rate λ . If `stop_step` is provided in build, then it will be determined automatically and overwritten.

Methods

<code>build(global_step[, stop_step])</code>	Build the learning rate.
<code>start_lr()</code>	Get the start lr.
<code>value(step)</code>	Get the lr at a certain step.

build(global_step: Tensor, stop_step: int | None = None) → Tensor

Build the learning rate.

Parameters

- `global_step`
The tf Tensor providing the global training step
- `stop_step`
The stop step. If provided, the `decay_rate` will be determined automatically and overwritten.

Returns

- learning_rate**
The learning rate

start_lr() → float

Get the start lr.

value(step: int) → float

Get the lr at a certain step.

deepmd.utils.multi_init module

deepmd.utils.multi_init.replace_model_params_with_frz_multi_model(jdata: Dict[str, Any], pretrained_model: str)

Replace the model params in input script according to pretrained frozen multi-task united model.

Parameters

- `jdata`
[Dict[str, Any]] input script

pretrained_model
 [str] filename of the pretrained frozen multi-task united model

deepmd.utils.neighbor_stat module

class deepmd.utils.neighbor_stat.NeighborStat(ntypes: int, rcut: float, one_type: bool = False)

Bases: object

Class for getting training data information.

It loads data from DeepmdData object, and measures the data info, including nearest nbor distance between atoms, max nbor size of atoms and the output data range of the environment matrix.

Parameters

ntypes
 The num of atom types

rcut
 The cut-off radius

one_type
 [bool, optional, default=False] Treat all types as a single type.

Methods

<i>get_stat</i> (data)	get the data statistics of the training data, including nearest nbor distance between atoms, max nbor size of atoms.
------------------------	--

get_stat(data: DeepmdDataSystem) → Tuple[float, List[int]]

get the data statistics of the training data, including nearest nbor distance between atoms, max nbor size of atoms.

Parameters

data
 Class for manipulating many data systems. It is implemented with the help of DeepmdData.

Returns

min_nbor_dist
 The nearest distance between neighbor atoms

max_nbor_size
 A list with ntypes integers, denotes the actual achieved max sel

deepmd.utils.network module

```
deepmd.utils.network.embedding_net(xx, network_size, precision, activation_fn=<function tanh>,
                                   resnet_dt=False, name_suffix='', stddev=1.0, bavg=0.0,
                                   seed=None, trainable=True, uniform_seed=False,
                                   initial_variables=None, mixed_prec=None)
```

The embedding network.

The embedding network function \mathcal{N} is constructed by is the composition of multiple layers $\mathcal{L}^{(i)}$:

$$\mathcal{N} = \mathcal{L}^{(n)} \circ \mathcal{L}^{(n-1)} \circ \dots \circ \mathcal{L}^{(1)}$$

A layer \mathcal{L} is given by one of the following forms, depending on the number of nodes: [1]

$$y = \mathcal{L}(x; w, b) = \begin{cases} \phi(x^T w + b) + x, & N_2 = N_1 \\ \phi(x^T w + b) + (x, x), & N_2 = 2N_1 \\ \phi(x^T w + b), & \text{otherwise} \end{cases}$$

where $x \in \mathbb{R}^{N_1}$ is the input vector and $y \in \mathbb{R}^{N_2}$ is the output vector. $w \in \mathbb{R}^{N_1 \times N_2}$ and $b \in \mathbb{R}^{N_2}$ are weights and biases, respectively, both of which are trainable if trainable is True. ϕ is the activation function.

Parameters

`xx`

[**Tensor**] Input tensor x of shape [-1,1]

`network_size`

[**list of int**] Size of the embedding network. For example [16,32,64]

`precision`:

Precision of network weights. For example, tf.float64

`activation_fn`:

Activation function ϕ

`resnet_dt`

[**bool**] Using time-step in the ResNet construction

`name_suffix`

[**str**] The name suffix append to each variable.

`stddev`

[**float**] Standard deviation of initializing network parameters

`bavg`

[**float**] Mean of network initial bias

`seed`

[**int**] Random seed for initializing network parameters

`trainable`

[**bool**] If the network is trainable

`uniform_seed`

[**bool**] Only for the purpose of backward compatibility, retrieves the old behavior of using the random seed

`initial_variables`

[**dict**] The input dict which stores the embedding net variables

`mixed_prec`
The input dict which stores the mixed precision setting for the embedding net

deepmd.utils.network.one_layer_rand_seed_shift()

deepmd.utils.network.variable_summaries(var: VariableV1, name: str)
    Attach a lot of summaries to a Tensor (for TensorBoard visualization).

    Parameters
    var
        [tf.Variable] [description]
    name
        [str] variable name
```

deepmd.utils.pair_tab module

```
class deepmd.utils.pair_tab.PairTab(filename: str)
    Bases: object

    Parameters
    filename
        File name for the short-range tabulated potential. The table is a text data file with
         $(N_t + 1) * N_t / 2 + 1$  columes. The first colum is the distance between atoms. The
        second to the last columes are energies for pairs of certain types. For example we
        have two atom types, 0 and 1. The columes from 2nd to 4th are for 0-0, 0-1 and 1-1
        correspondingly.
```

Methods

<code>get()</code>	Get the serialized table.
<code>reinit(filename)</code>	Initialize the tabulated interaction.

`get()` → Tuple[array, array]
Get the serialized table.

`reinit(filename: str) → None`

Initialize the tabulated interaction.

Parameters

filename

File name for the short-range tabulated potential. The table is a text data file with $(N_t + 1) * N_t / 2 + 1$ columns. The first column is the distance between atoms. The second to the last columns are energies for pairs of certain types. For example we have two atom types, 0 and 1. The columns from 2nd to 4th are for 0-0, 0-1 and 1-1 correspondingly.

deepmd.utils.parallel_op module

```
class deepmd.utils.parallel_op.ParallelOp(builder: Callable[[...], Tuple[Dict[str, Tensor],
                                                                    Tuple[Tensor]]], nthreads: int | None = None, config:
                                                                    ConfigProto | None = None)
```

Bases: `object`

Run an op with data parallelism.

Parameters

builder

`[Callable[...], Tuple[Dict[str, tf.Tensor], Tuple[tf.Tensor]]]` returns two objects: a dict which stores placeholders by key, and a tuple with the final op(s)

nthreads

`[int, optional]` the number of threads

config

`[tf.ConfigProto, optional]` `tf.ConfigProto`

Examples

```
>>> from deepmd.env import tf
>>> from deepmd.utils.parallel_op import ParallelOp
>>> def builder():
...     x = tf.placeholder(tf.int32, [1])
...     return {"x": x}, (x + 1)
...
>>> p = ParallelOp(builder, nthreads=4)
>>> def feed():
...     for ii in range(10):
...         yield {"x": [ii]}
...
>>> print(*p.generate(tf.Session(), feed()))
[1] [2] [3] [4] [5] [6] [7] [8] [9] [10]
```

Methods

<code>generate(sess, feed)</code>	Returns a generator.
-----------------------------------	----------------------

generate(sess: Session, feed: Generator[Dict[str, Any], None, None]) → Generator[Tuple, None, None]

Returns a generator.

Parameters

sess
[`tf.Session`] TensorFlow session

feed
[Generator[dict, None, None]] generator which yields feed_dict

Yields

Generator[Tuple, None, None]
generator which yields session returns

deepmd.utils.path module

class deepmd.utils.path.DPH5Path(path: str)

Bases: *DPPath*

The path class to data system (DeepmdData) for HDF5 files.

Parameters

path
[str] path

Notes

OS - HDF5 relationship:
directory - Group file - Dataset

Methods

<code>glob(pattern)</code>	Search path using the glob pattern.
<code>is_dir()</code>	Check if self is directory.
<code>is_file()</code>	Check if self is file.
<code>load_numpy()</code>	Load NumPy array.
<code>load_txt([dtype])</code>	Load NumPy array from text.
<code>rglob(pattern)</code>	This is like calling <i>DPPath.glob()</i> with <code>**/</code> added in front of the given relative pattern.

glob(pattern: str) → List[DPPath]

Search path using the glob pattern.

Parameters

```
    pattern
    [str] glob pattern

Returns
    List[DPPath]
    list of paths

is_dir() → bool
    Check if self is directory.

is_file() → bool
    Check if self is file.

load_numpy() → ndarray
    Load NumPy array.

Returns
    np.ndarray
    loaded NumPy array

load_txt(dtype: dtype | None = None, **kwargs) → ndarray
    Load NumPy array from text.

Returns
    np.ndarray
    loaded NumPy array

rglob(pattern: str) → List[DPPath]
    This is like calling DPPath.glob() with **/ added in front of the given relative pattern.

Parameters
    pattern
    [str] glob pattern

Returns
    List[DPPath]
    list of paths

class deepmd.utils.path.DPOSPath(path: str)
    Bases: DPPath

    The OS path class to data system (DeepmdData) for real directories.

Parameters
    path
    [str] path
```

Methods

<code>glob(pattern)</code>	Search path using the glob pattern.
<code>is_dir()</code>	Check if self is directory.
<code>is_file()</code>	Check if self is file.
<code>load_numpy()</code>	Load NumPy array.
<code>load_txt(**kwargs)</code>	Load NumPy array from text.
<code>rglob(pattern)</code>	This is like calling <code>DPPath.glob()</code> with <code>**/</code> added in front of the given relative pattern.

`glob(pattern: str) → List[DPPath]`

Search path using the glob pattern.

Parameters

pattern
[`str`] glob pattern

Returns

`List[DPPath]`
list of paths

`is_dir() → bool`

Check if self is directory.

`is_file() → bool`

Check if self is file.

`load_numpy() → ndarray`

Load NumPy array.

Returns

`np.ndarray`
loaded NumPy array

`load_txt(**kwargs) → ndarray`

Load NumPy array from text.

Returns

`np.ndarray`
loaded NumPy array

`rglob(pattern: str) → List[DPPath]`

This is like calling `DPPath.glob()` with `**/` added in front of the given relative pattern.

Parameters

pattern
[`str`] glob pattern

Returns

`List[DPPath]`
list of paths

```
class deepmd.utils.path.DPPath(path: str)
    Bases: ABC
    The path class to data system (DeepmdData).
    Parameters
        path
            [str] path
```

Methods

<i>glob</i> (pattern)	Search path using the glob pattern.
<i>is_dir</i> ()	Check if self is directory.
<i>is_file</i> ()	Check if self is file.
<i>load_numpy</i> ()	Load NumPy array.
<i>load_txt</i> (**kwargs)	Load NumPy array from text.
<i>rglob</i> (pattern)	This is like calling <i>DPPath.glob()</i> with <i>**/</i> added in front of the given relative pattern.

```
abstract glob(pattern: str) → List[DPPath]
```

Search path using the glob pattern.

Parameters

pattern
[str] glob pattern

Returns

List[DPPath]
list of paths

```
abstract is_dir() → bool
```

Check if self is directory.

```
abstract is_file() → bool
```

Check if self is file.

```
abstract load_numpy() → ndarray
```

Load NumPy array.

Returns

np.ndarray
loaded NumPy array

```
abstract load_txt(**kwargs) → ndarray
```

Load NumPy array from text.

Returns

np.ndarray
loaded NumPy array

abstract `rglob(pattern: str) → List[DPPath]`

This is like calling `DPPath.glob()` with `**/` added in front of the given relative pattern.

Parameters

`pattern`
[`str`] glob pattern

Returns

`List[DPPath]`
list of paths

deepmd.utils.plugin module

Base of plugin systems.

class `deepmd.utils.plugin.Plugin`

Bases: `object`

A class to register and restore plugins.

Examples

```
>>> plugin = Plugin()
>>> @plugin.register("xx")
def xxx():
    pass
>>> print(plugin.plugins['xx'])
```

Attributes

`plugins`
[`Dict[str, object]`] plugins

Methods

<code>get_plugin(key)</code>	Visit a plugin by key.
<code>register(key)</code>	Register a plugin.

get_plugin(key) → object

Visit a plugin by key.

Parameters

`key`
[`str`] key of the plugin

Returns

`object`
the plugin

register(key: `str`) → `Callable[[object], object]`

Register a plugin.

Parameters

key
[`str`] key of the plugin

Returns

`Callable[[object], object]`
decorator

class `deepmd.utils.plugin.PluginVariant(*args, **kwargs)`

Bases: `object`

A class to remove type from input arguments.

class `deepmd.utils.plugin.VariantABCMeta(name, bases, namespace, **kwargs)`

Bases: `VariantMeta`, `ABCMeta`

Methods

<code>__call__(*args, **kwargs)</code>	Remove type and keys that starts with underline.
<code>mro()</code>	Return a type's method resolution order.
<code>register(subclass)</code>	Register a virtual subclass of an ABC.

class `deepmd.utils.plugin.VariantMeta`

Bases: `object`

Methods

<code>__call__(*args, **kwargs)</code>	Remove type and keys that starts with underline.
--	--

deepmd.utils.random module

deepmd.utils.random.choice(a: `ndarray`, p: `ndarray` | `None` = `None`)

Generates a random sample from a given 1-D array.

Parameters

a
[`np.ndarray`] A random sample is generated from its elements.

p
[`np.ndarray`] The probabilities associated with each entry in a.

Returns

`np.ndarray`
arrays with results and their shapes

`deepmd.utils.random.random(size=None)`

Return random floats in the half-open interval [0.0, 1.0).

Parameters

`size`

Output shape.

Returns

`np.ndarray`

Arrays with results and their shapes.

`deepmd.utils.random.seed(val: int | None = None)`

Seed the generator.

Parameters

`val`

[`int`] Seed.

`deepmd.utils.random.shuffle(x: ndarray)`

Modify a sequence in-place by shuffling its contents.

Parameters

`x`

[`np.ndarray`] The array or list to be shuffled.

deepmd.utils.sess module

`deepmd.utils.sess.run_sess(sess: Session, *args, **kwargs)`

Run session with errors caught.

Parameters

`sess`

[`tf.Session`] TensorFlow Session

`*args`

Variable length argument list.

`**kwargs`

Arbitrary keyword arguments.

Returns

`Any`

the result of `sess.run()`

deepmd.utils.tabulate module

```
class deepmd.utils.tabulate.DPTabulate(descrpt: ~deepmd.descriptor.descriptor.Descriptor, neuron:
    ~typing.List[int], graph:
    ~tensorflow.python.framework.ops.Graph, graph_def:
    ~tensorflow.core.framework.graph_pb2.GraphDef,
    type_one_side: bool = False, exclude_types:
    ~typing.List[~typing.List[int]] = [], activation_fn: ~typing.Callable[~tensorflow.python.framework.ops.Tensor],
    ~tensorflow.python.framework.ops.Tensor] = <function
    tanh>, suffix: str = '')
```

Bases: `object`

Class for tabulation.

Compress a model, which including tabulating the embedding-net. The table is composed of fifth-order polynomial coefficients and is assembled from two sub-tables. The first table takes the stride(parameter) as it's uniform stride, while the second table takes $10 * \text{stride}$ as it's uniform stride. The range of the first table is automatically detected by deepmd-kit, while the second table ranges from the first table's upper boundary(upper) to the extrapolate(parameter) * upper.

Parameters

`descrpt`
Descriptor of the original model

`neuron`
Number of neurons in each hidden layers of the embedding net
mathcal{N}

`graph`
[`tf.Graph`] The graph of the original model

`graph_def`
[`tf.GraphDef`] The graph_def of the original model

`type_one_side`
Try to build N_{types} tables. Otherwise, building N_{types}^2 tables

`exclude_types`
[`List[List[int]]`] The excluded pairs of types which have no interaction with each other. For example, `[[0, 1]]` means no interaction between type 0 and type 1.

`activation_function`
The activation function in the embedding net. Supported options are {"tanh", "gelu"} in common.ACTIVATION_FN_DICT.

`suffix`
[`str`, optional] The suffix of the scope

Methods

<code>build(min_nbor_dist, extrapolate, stride0, ...)</code>	Build the tables for model compression.
--	---

build(min_nbor_dist: float, extrapolate: float, stride0: float, stride1: float) → Tuple[Dict[str, int], Dict[str, int]]

Build the tables for model compression.

Parameters

min_nbor_dist

The nearest distance between neighbor atoms

extrapolate

The scale of model extrapolation

stride0

The uniform stride of the first table

stride1

The uniform stride of the second table

Returns

lower

[dict[str, int]] The lower boundary of environment matrix by net

upper

[dict[str, int]] The upper boundary of environment matrix by net

deepmd.utils.type_embed module

class deepmd.utils.type_embed.TypeEmbedNet(neuron: List[int] = [], resnet_dt: bool = False, activation_function: str | None = 'tanh', precision: str = 'default', trainable: bool = True, seed: int | None = None, uniform_seed: bool = False, padding: bool = False)

Bases: object

Type embedding network.

Parameters

neuron

[list[int]] Number of neurons in each hidden layers of the embedding net

resnet_dt

Time-step dt in the resnet construction: $y = x + dt * \phi(Wx + b)$

activation_function

The activation function in the embedding net. Supported options are "relu", "relu6", "softplus", "sigmoid", "tanh", "gelu", "gelu_tf", "None", "none".

precision

The precision of the embedding net parameters. Supported options are "default", "float16", "float32", "float64", "bfloat16".

trainable
If the weights of embedding net are trainable.

seed
Random seed for initializing the network parameters.

uniform_seed
Only for the purpose of backward compatibility, retrieves the old behavior of using the random seed

padding
Concat the zero padding to the output, as the default embedding of empty type.

Methods

<code>build(ntypes[, reuse, suffix])</code>	Build the computational graph for the descriptor.
<code>init_variables(graph, graph_def[, suffix])</code>	Init the type embedding net variables with the given dict.

build(ntypes: `int`, reuse=None, suffix='')
Build the computational graph for the descriptor.

Parameters

ntypes
Number of atom types.

reuse
The weights in the networks should be reused when get the variable.

suffix
Name suffix to identify this descriptor

Returns

embedded_types
The computational graph for embedded types

init_variables(graph: `Graph`, graph_def: `GraphDef`, suffix='') → `None`

Init the type embedding net variables with the given dict.

Parameters

graph
[`tf.Graph`] The input frozen model graph

graph_def
[`tf.GraphDef`] The input frozen model graph_def

suffix
Name suffix to identify this descriptor

deepmd.utils.type_embed.embed_atom_type(ntypes: `int`, natoms: `Tensor`, type_embedding: `Tensor`)

Make the embedded type for the atoms in system. The atoms are assumed to be sorted according to the type, thus their types are described by a `tf.Tensor` natoms, see explanation below.

Parameters

`ntypes:`
 Number of types.
`natoms:`
 The number of atoms. This tensor has the length of `Ntypes + 2` `natoms[0]`: number of local atoms `natoms[1]`: total number of atoms held by this processor `natoms[i]`: $2 \leq i < Ntypes+2$, number of type `i` atoms
`type_embedding:`
 The type embedding. It has the shape of `[ntypes, embedding_dim]`
 Returns
`atom_embedding`
 The embedded type of each atom. It has the shape of `[numb_atoms, embedding_dim]`

deepmd.utils.weight_avg module

`deepmd.utils.weight_avg.weighted_average(errors: List[Dict[str, Tuple[float, float]]]) → Dict`

Compute wighted average of prediction errors (MAE or RMSE) for model.

Parameters

`errors`

`[List[Dict[str, Tuple[float, float]]]]` List: the error of systems Dict: the error of quantities, name given by the key `str`: the name of the quantity, must starts with 'mae' or 'rmse' Tuple: (error, weight)

Returns

`Dict`

weighted averages

17.1.2 Submodules

17.1.3 deepmd.calculator module

ASE calculator interface module.

`class deepmd.calculator.DP(model: str | Path, label: str = 'DP', type_dict: Dict[str, int] | None = None, **kwargs)`

Bases: `Calculator`

Implementation of ASE deepmd calculator.

Implemented propertie are energy, forces and stress

Parameters

`model`

`[Union[str, Path]]` path to the model

`label`

`[str, optional]` calculator label, by default "DP"

`type_dict`

`[Dict[str, int], optional]` mapping of element types and their numbers, best left None and the calculator will infer this information from model, by default None

Examples

Compute potential energy

```
>>> from ase import Atoms
>>> from deepmd.calculator import DP
>>> water = Atoms('H2O',
>>>               positions=[(0.7601, 1.9270, 1),
>>>                           (1.9575, 1, 1),
>>>                           (1., 1., 1.)],
>>>               cell=[100, 100, 100],
>>>               calculator=DP(model="frozen_model.pb"))
>>> print(water.get_potential_energy())
>>> print(water.get_forces())
```

Run BFGS structure optimization

```
>>> from ase.optimize import BFGS
>>> dyn = BFGS(water)
>>> dyn.run(fmax=1e-6)
>>> print(water.get_positions())
```

Attributes

directory
label

Methods

<code>band_structure()</code>	Create band-structure object for plotting.
<code>calculate([atoms, properties, system_changes])</code>	Run calculation with deepmd model.
<code>calculate_numerical_forces(atoms[, d])</code>	Calculate numerical forces using finite difference.
<code>calculate_numerical_stress(atoms[, d, voigt])</code>	Calculate numerical stress using finite difference.
<code>calculate_properties(atoms, properties)</code>	This method is experimental; currently for internal use.
<code>check_state(atoms[, tol])</code>	Check for any system changes since last calculation.
<code>get_magnetic_moments([atoms])</code>	Calculate magnetic moments projected onto atoms.
<code>get_property(name[, atoms, allow_calculation])</code>	Get the named property.
<code>get_stresses([atoms])</code>	the calculator should return intensive stresses, i.e., such that <code>stresses.sum(axis=0) == stress</code>
<code>read(label)</code>	Read atoms, parameters and calculated properties from output file.
<code>reset()</code>	Clear all information from old calculation.
<code>set(**kwargs)</code>	Set parameters like <code>set(key1=value1, key2=value2, ...)</code> .
<code>set_label(label)</code>	Set label and convert label to directory and prefix.

calculation_required
export_properties
get_atoms
get_charges
get_default_parameters
get_dipole_moment
get_forces
get_magnetic_moment
get_potential_energies
get_potential_energy
get_stress
read_atoms
todict

```
calculate(atoms: Atoms | None = None, properties: List[str] = ['energy', 'forces', 'virial'],
          system_changes: List[str] = ['positions', 'numbers', 'cell', 'pbc', 'initial_charges',
          'initial_magmoms'])
```

Run calculation with deepmd model.

Parameters

atoms
[Optional[Atoms], optional] atoms object to run the calculation on, by default None

properties
[List[str], optional] unused, only for function signature compatibility, by default ["energy", "forces", "stress"]

system_changes
[List[str], optional] unused, only for function signature compatibility, by default all_changes

```
implemented_properties: List[str] = ['energy', 'free_energy', 'forces', 'virial',
'stress']
```

Properties calculator can handle (energy, forces, ...)

```
name = 'DP'
```

17.1.4 deepmd.common module

Collection of functions and classes used throughout the whole package.

```
deepmd.common.add_data_requirement(key: str, ndof: int, atomic: bool = False, must: bool = False,
                                   high_prec: bool = False, type_sel: bool | None = None, repeat: int
                                   = 1, default: float = 0.0, dtype: dtype | None = None)
```

Specify data requirements for training.

Parameters

key
[str] type of data stored in corresponding *.npz file e.g. forces or energy

ndof
[int] number of the degrees of freedom, this is tied to atomic parameter e.g. forces have atomic=True and ndof=3

`atomic`
 [`bool`, `optional`] specifies whether the `ndof` keyword applies to per atom quantity or not, by default `False`

`must`
 [`bool`, `optional`] specifies if the `*.npz` data file must exist, by default `False`

`high_prec`
 [`bool`, `optional`] if true load data to `np.float64` else `np.float32`, by default `False`

`type_sel`
 [`bool`, `optional`] select only certain type of atoms, by default `None`

`repeat`
 [`int`, `optional`] if specify repeat data repeat times, by default `1`

`default`
 [`float`, `optional`, `default=0.`] default value of data

`dtype`
 [`np.dtype`, `optional`] the dtype of data, overwrites `high_prec` if provided

`deepmd.common.cast_precision(func: Callable) → Callable`

A decorator that casts and casts back the input and output tensor of a method.

The decorator should be used in a classmethod.

The decorator will do the following thing: (1) It casts input Tensors from `GLOBAL_TF_FLOAT_PRECISION` to precision defined by property `precision`. (2) It casts output Tensors from precision to `GLOBAL_TF_FLOAT_PRECISION`. (3) It checks inputs and outputs and only casts when input or output is a `Tensor` and its dtype matches `GLOBAL_TF_FLOAT_PRECISION` and precision, respectively. If it does not match (e.g. it is an integer), the decorator will do nothing on it.

Returns

`Callable`

a decorator that casts and casts back the input and output tensor of a method

Examples

```
>>> class A:
...     @property
...     def precision(self):
...         return tf.float32
...
...     @cast_precision
...     def f(x: tf.Tensor, y: tf.Tensor) -> tf.Tensor:
...         return x ** 2 + y
```

`deepmd.common.clear_session()`

Reset all state generated by DeePMD-kit.

`deepmd.common.expand_sys_str(root_dir: str | Path) → List[str]`

Recursively iterate over directories taking those that contain type.raw file.

Parameters

`root_dir`

[`Union[str, Path]`] starting directory

Returns

`List[str]`
list of string pointing to system directories

`deepmd.common.gelu(x: Tensor) → Tensor`

Gaussian Error Linear Unit.

This is a smoother version of the RELU, implemented by custom operator.

Parameters

`x`
`[tf.Tensor]` float Tensor to perform activation

Returns

`tf.Tensor`
x with the GELU activation applied

References

Original paper <https://arxiv.org/abs/1606.08415>

`deepmd.common.gelu_tf(x: Tensor) → Tensor`

Gaussian Error Linear Unit.

This is a smoother version of the RELU, implemented by TF.

Parameters

`x`
`[tf.Tensor]` float Tensor to perform activation

Returns

`tf.Tensor`
x with the GELU activation applied

References

Original paper <https://arxiv.org/abs/1606.08415>

`deepmd.common.get_activation_func(activation_fn: _ACTIVATION | None) → Callable[[Tensor], Tensor] | None`

Get activation function callable based on string name.

Parameters

`activation_fn`
`[_ACTIVATION]` one of the defined activation functions

Returns

`Callable[[tf.Tensor], tf.Tensor]`
corresponding TF callable

Raises

`RuntimeError`
if unknown activation function is specified

`deepmd.common.get_np_precision(precision: _PRECISION) → dtype`

Get numpy precision constant from string.

Parameters

precision
[_PRECISION] string name of numpy constant or default

Returns

np.dtype
numpy precision constant

Raises

RuntimeError
if string is invalid

`deepmd.common.get_precision(precision: _PRECISION) → Any`

Convert str to TF DType constant.

Parameters

precision
[_PRECISION] one of the allowed precisions

Returns

tf.python.framework.dtypes.DType
appropriate TF constant

Raises

RuntimeError
if supplied precision string does not have a corresponding TF constant

`deepmd.common.j_loader(filename: str | Path) → Dict[str, Any]`

Load yaml or json settings file.

Parameters

filename
[Union[str, Path]] path to file

Returns

Dict[str, Any]
loaded dictionary

Raises

TypeError
if the supplied file is of unsupported type

`deepmd.common.j_must_have(jdata: Dict[str, _DICT_VAL], key: str, deprecated_key: List[str] = []) → _DICT_VAL`

Assert that supplied dictionary contains specified key.

Returns

_DICT_VAL
value that was stored under supplied key

Raises

`RuntimeError`

if the key is not present

`deepmd.common.make_default_mesh(test_box: ndarray, cell_size: float = 3.0) → ndarray`

Get number of cells of size='cell_size' fit into average box.

Parameters

`test_box`

[`np.ndarray`] numpy array with cells of shape Nx9

`cell_size`

[`float`, optional] length of one cell, by default 3.0

Returns

`np.ndarray`

mesh for supplied boxes, how many cells fit in each direction

`deepmd.common.safe_cast_tensor(input: Tensor, from_precision: DType, to_precision: DType) → Tensor`

Convert a Tensor from a precision to another precision.

If input is not a Tensor or without the specific precision, the method will not cast it.

Parameters

`input`

[`tf.Tensor`] input tensor

`from_precision`

[`tf.DType`] Tensor data type that is casted from

`to_precision`

[`tf.DType`] Tensor data type that casts to

Returns

`tf.Tensor`

casted Tensor

`deepmd.common.select_idx_map(atom_types: ndarray, select_types: ndarray) → ndarray`

Build map of indices for element supplied element types from all atoms list.

Parameters

`atom_types`

[`np.ndarray`] array specifying type for each atoms as integer

`select_types`

[`np.ndarray`] types of atoms you want to find indices for

Returns

`np.ndarray`

indices of types of atoms defined by select_types in atom_types array

Warning: select_types array will be sorted before finding indices in atom_types

17.1.5 deepmd.env module

Module that sets tensorflow working environment and exports important constants.

`deepmd.env.GLOBAL_ENER_FLOAT_PRECISION`

alias of `float64`

`deepmd.env.GLOBAL_NP_FLOAT_PRECISION`

alias of `float64`

`deepmd.env.global_cvt_2_ener_float(xx: Tensor) → Tensor`

Cast tensor to globally set energy precision.

Parameters

`xx`

[`tf.Tensor`] input tensor

Returns

`tf.Tensor`

output tensor cast to `GLOBAL_ENER_FLOAT_PRECISION`

`deepmd.env.global_cvt_2_tf_float(xx: Tensor) → Tensor`

Cast tensor to globally set TF precision.

Parameters

`xx`

[`tf.Tensor`] input tensor

Returns

`tf.Tensor`

output tensor cast to `GLOBAL_TF_FLOAT_PRECISION`

`deepmd.env.reset_default_tf_session_config(cpu_only: bool)`

Limit tensorflow session to CPU or not.

Parameters

`cpu_only`

[`bool`] If enabled, no GPU device is visible to the TensorFlow Session.

17.1.6 deepmd.lmp module

18.1 op_module

Python wrappers around TensorFlow ops.

This file is MACHINE GENERATED! Do not edit.

```
deepmd.env.op_module.AddFltNvnmd(x, w, name=None)
```

TODO: add doc.

Parameters

- **x** – A Tensor. Must be one of the following types: float32, float64.
- **w** – A Tensor. Must have the same type as x.
- **name** – A name for the operation (optional).

Returns

A Tensor. Has the same type as x.

```
deepmd.env.op_module.CopyFltNvnmd(x, name=None)
```

TODO: add doc.

Parameters

- **x** – A Tensor. Must be one of the following types: float32, float64.
- **name** – A name for the operation (optional).

Returns

A tuple of Tensor objects (y1, y2).

y1: A Tensor. Has the same type as x. y2: A Tensor. Has the same type as x.

```
deepmd.env.op_module.Descript(coord, type, natoms, box, mesh, davg, dstd, rcut_a, rcut_r, sel_a, sel_r,  
                               axis_rule, name=None)
```

TODO: add doc.

Parameters

- **coord** – A Tensor. Must be one of the following types: float32, float64.
- **type** – A Tensor of type int32.
- **natoms** – A Tensor of type int32.
- **box** – A Tensor. Must have the same type as coord.
- **mesh** – A Tensor of type int32.

- **davg** – A Tensor. Must have the same type as coord.
- **dstd** – A Tensor. Must have the same type as coord.
- **rcut_a** – A float.
- **rcut_r** – A float.
- **sel_a** – A list of ints.
- **sel_r** – A list of ints.
- **axis_rule** – A list of ints.
- **name** – A name for the operation (optional).

Returns

A tuple of Tensor objects (descript, descript_deriv, rij, nlist, axis, rot_mat).

descript: A Tensor. Has the same type as coord. descript_deriv: A Tensor. Has the same type as coord. rij: A Tensor. Has the same type as coord. nlist: A Tensor of type int32. axis: A Tensor of type int32. rot_mat: A Tensor. Has the same type as coord.

```
deepmd.env.op_module.DescriptNorot(coord, type, natoms, box, mesh, davg, dstd, rcut_a, rcut_r,  
                                   rcut_r_smth, sel_a, sel_r, name=None)
```

TODO: add doc.

Parameters

- **coord** – A Tensor. Must be one of the following types: float32, float64.
- **type** – A Tensor of type int32.
- **natoms** – A Tensor of type int32.
- **box** – A Tensor. Must have the same type as coord.
- **mesh** – A Tensor of type int32.
- **davg** – A Tensor. Must have the same type as coord.
- **dstd** – A Tensor. Must have the same type as coord.
- **rcut_a** – A float.
- **rcut_r** – A float.
- **rcut_r_smth** – A float.
- **sel_a** – A list of ints.
- **sel_r** – A list of ints.
- **name** – A name for the operation (optional).

Returns

A tuple of Tensor objects (descript, descript_deriv, rij, nlist).

descript: A Tensor. Has the same type as coord. descript_deriv: A Tensor. Has the same type as coord. rij: A Tensor. Has the same type as coord. nlist: A Tensor of type int32.

```
deepmd.env.op_module.DescriptSeA(coord, type, natoms, box, mesh, davg, dstd, rcut_a, rcut_r,  
                                 rcut_r_smth, sel_a, sel_r, name=None)
```

TODO: add doc.

Parameters

- **coord** – A Tensor. Must be one of the following types: float32, float64.
- **type** – A Tensor of type int32.
- **natoms** – A Tensor of type int32.
- **box** – A Tensor. Must have the same type as coord.
- **mesh** – A Tensor of type int32.
- **davg** – A Tensor. Must have the same type as coord.
- **dstd** – A Tensor. Must have the same type as coord.
- **rcut_a** – A float.
- **rcut_r** – A float.
- **rcut_r_smth** – A float.
- **sel_a** – A list of ints.
- **sel_r** – A list of ints.
- **name** – A name for the operation (optional).

Returns

A tuple of Tensor objects (descript, descript_deriv, rij, nlist).

descript: A Tensor. Has the same type as coord. descript_deriv: A Tensor. Has the same type as coord. rij: A Tensor. Has the same type as coord. nlist: A Tensor of type int32.

```
deepmd.env.op_module.DescriptSeAEf(coord, type, natoms, box, mesh, ef, davg, dstd, rcut_a, rcut_r,
                                     rcut_r_smth, sel_a, sel_r, name=None)
```

TODO: add doc.

Parameters

- **coord** – A Tensor. Must be one of the following types: float32, float64.
- **type** – A Tensor of type int32.
- **natoms** – A Tensor of type int32.
- **box** – A Tensor. Must have the same type as coord.
- **mesh** – A Tensor of type int32.
- **ef** – A Tensor. Must have the same type as coord.
- **davg** – A Tensor. Must have the same type as coord.
- **dstd** – A Tensor. Must have the same type as coord.
- **rcut_a** – A float.
- **rcut_r** – A float.
- **rcut_r_smth** – A float.
- **sel_a** – A list of ints.
- **sel_r** – A list of ints.
- **name** – A name for the operation (optional).

Returns

A tuple of Tensor objects (descript, descript_deriv, rij, nlist).

descript: A Tensor. Has the same type as coord. descript_deriv: A Tensor. Has the same type as coord. rij: A Tensor. Has the same type as coord. nlist: A Tensor of type int32.

```
deepmd.env.op_module.DescriptSeAEfPara(coord, type, natoms, box, mesh, ef, davg, dstd, rcut_a, rcut_r,
                                         rcut_r_smth, sel_a, sel_r, name=None)
```

TODO: add doc.

Parameters

- **coord** – A Tensor. Must be one of the following types: float32, float64.
- **type** – A Tensor of type int32.
- **natoms** – A Tensor of type int32.
- **box** – A Tensor. Must have the same type as coord.
- **mesh** – A Tensor of type int32.
- **ef** – A Tensor. Must have the same type as coord.
- **davg** – A Tensor. Must have the same type as coord.
- **dstd** – A Tensor. Must have the same type as coord.
- **rcut_a** – A float.
- **rcut_r** – A float.
- **rcut_r_smth** – A float.
- **sel_a** – A list of ints.
- **sel_r** – A list of ints.
- **name** – A name for the operation (optional).

Returns

A tuple of Tensor objects (descript, descript_deriv, rij, nlist).

descript: A Tensor. Has the same type as coord. descript_deriv: A Tensor. Has the same type as coord. rij: A Tensor. Has the same type as coord. nlist: A Tensor of type int32.

```
deepmd.env.op_module.DescriptSeAEfVert(coord, type, natoms, box, mesh, ef, davg, dstd, rcut_a, rcut_r,
                                         rcut_r_smth, sel_a, sel_r, name=None)
```

TODO: add doc.

Parameters

- **coord** – A Tensor. Must be one of the following types: float32, float64.
- **type** – A Tensor of type int32.
- **natoms** – A Tensor of type int32.
- **box** – A Tensor. Must have the same type as coord.
- **mesh** – A Tensor of type int32.
- **ef** – A Tensor. Must have the same type as coord.
- **davg** – A Tensor. Must have the same type as coord.
- **dstd** – A Tensor. Must have the same type as coord.

- **rcut_a** – A float.
- **rcut_r** – A float.
- **rcut_r_smth** – A float.
- **sel_a** – A list of ints.
- **sel_r** – A list of ints.
- **name** – A name for the operation (optional).

Returns

A tuple of Tensor objects (descript, descript_deriv, rij, nlist).

descript: A Tensor. Has the same type as coord. descript_deriv: A Tensor. Has the same type as coord. rij: A Tensor. Has the same type as coord. nlist: A Tensor of type int32.

`deepmd.env.op_module.DescriptSeAMask(coord, type, mask, box, natoms, mesh, name=None)`

TODO: add doc.

Parameters

- **coord** – A Tensor. Must be one of the following types: float32, float64.
- **type** – A Tensor of type int32.
- **mask** – A Tensor of type int32.
- **box** – A Tensor. Must have the same type as coord.
- **natoms** – A Tensor of type int32.
- **mesh** – A Tensor of type int32.
- **name** – A name for the operation (optional).

Returns

A tuple of Tensor objects (descript, descript_deriv, rij, nlist).

descript: A Tensor. Has the same type as coord. descript_deriv: A Tensor. Has the same type as coord. rij: A Tensor. Has the same type as coord. nlist: A Tensor of type int32.

`deepmd.env.op_module.DescriptSeR(coord, type, natoms, box, mesh, davg, dstd, rcut, rcut_smth, sel, name=None)`

TODO: add doc.

Parameters

- **coord** – A Tensor. Must be one of the following types: float32, float64.
- **type** – A Tensor of type int32.
- **natoms** – A Tensor of type int32.
- **box** – A Tensor. Must have the same type as coord.
- **mesh** – A Tensor of type int32.
- **davg** – A Tensor. Must have the same type as coord.
- **dstd** – A Tensor. Must have the same type as coord.
- **rcut** – A float.
- **rcut_smth** – A float.

- **sel** – A list of ints.
- **name** – A name for the operation (optional).

Returns

A tuple of Tensor objects (descript, descript_deriv, rij, nlist).

descript: A Tensor. Has the same type as coord. descript_deriv: A Tensor. Has the same type as coord. rij: A Tensor. Has the same type as coord. nlist: A Tensor of type int32.

`deepmd.env.op_module.DotmulFltNvnmd(x, w, name=None)`

TODO: add doc.

Parameters

- **x** – A Tensor. Must be one of the following types: float32, float64.
- **w** – A Tensor. Must have the same type as x.
- **name** – A name for the operation (optional).

Returns

A Tensor. Has the same type as x.

`deepmd.env.op_module.EwaldRecp(coord, charge, natoms, box, ewald_beta, ewald_h, name=None)`

TODO: add doc.

Parameters

- **coord** – A Tensor. Must be one of the following types: float32, float64.
- **charge** – A Tensor. Must have the same type as coord.
- **natoms** – A Tensor of type int32.
- **box** – A Tensor. Must have the same type as coord.
- **ewald_beta** – A float.
- **ewald_h** – A float.
- **name** – A name for the operation (optional).

Returns

A tuple of Tensor objects (energy, force, virial).

energy: A Tensor. Has the same type as coord. force: A Tensor. Has the same type as coord. virial: A Tensor. Has the same type as coord.

`deepmd.env.op_module.FltNvnmd(x, name=None)`

TODO: add doc.

Parameters

- **x** – A Tensor. Must be one of the following types: float32, float64.
- **name** – A name for the operation (optional).

Returns

A Tensor. Has the same type as x.

`deepmd.env.op_module.Gelu(x, name=None)`

TODO: add doc.

Parameters

- **x** – A Tensor. Must be one of the following types: float32, float64.
- **name** – A name for the operation (optional).

Returns

A Tensor. Has the same type as x.

`deepmd.env.op_module.GeluCustom(x, name=None)`

TODO: add doc.

Parameters

- **x** – A Tensor. Must be one of the following types: float32, float64.
- **name** – A name for the operation (optional).

Returns

A Tensor. Has the same type as x.

`deepmd.env.op_module.GeluGrad(dy, x, name=None)`

TODO: add doc.

Parameters

- **dy** – A Tensor. Must be one of the following types: float32, float64.
- **x** – A Tensor. Must have the same type as dy.
- **name** – A name for the operation (optional).

Returns

A Tensor. Has the same type as dy.

`deepmd.env.op_module.GeluGradCustom(dy, x, name=None)`

TODO: add doc.

Parameters

- **dy** – A Tensor. Must be one of the following types: float32, float64.
- **x** – A Tensor. Must have the same type as dy.
- **name** – A name for the operation (optional).

Returns

A Tensor. Has the same type as dy.

`deepmd.env.op_module.GeluGradGrad(dy, dy_, x, name=None)`

TODO: add doc.

Parameters

- **dy** – A Tensor. Must be one of the following types: float32, float64.
- **dy_** – A Tensor. Must have the same type as dy.
- **x** – A Tensor. Must have the same type as dy.
- **name** – A name for the operation (optional).

Returns

A Tensor. Has the same type as dy.

`deepmd.env.op_module.GeluGradGradCustom(dy, dy_, x, name=None)`

TODO: add doc.

Parameters

- **dy** – A Tensor. Must be one of the following types: float32, float64.
- **dy_** – A Tensor. Must have the same type as dy.
- **x** – A Tensor. Must have the same type as dy.
- **name** – A name for the operation (optional).

Returns

A Tensor. Has the same type as dy.

`deepmd.env.op_module.MapAparam(aparam, nlist, natoms, n_a_sel, n_r_sel, name=None)`

TODO: add doc.

Parameters

- **aparam** – A Tensor. Must be one of the following types: float32, float64.
- **nlist** – A Tensor of type int32.
- **natoms** – A Tensor of type int32.
- **n_a_sel** – An int.
- **n_r_sel** – An int.
- **name** – A name for the operation (optional).

Returns

A Tensor. Has the same type as aparam.

`deepmd.env.op_module.MapFltNvnmd(x, table, table_grad, table_info, name=None)`

TODO: add doc.

Parameters

- **x** – A Tensor. Must be one of the following types: float32, float64.
- **table** – A Tensor. Must have the same type as x.
- **table_grad** – A Tensor. Must have the same type as x.
- **table_info** – A Tensor. Must have the same type as x.
- **name** – A name for the operation (optional).

Returns

A Tensor. Has the same type as x.

`deepmd.env.op_module.MatmulFitnetNvnmd(x, w, nbitx, nbitw, normw, name=None)`

TODO: add doc.

Parameters

- **x** – A Tensor. Must be one of the following types: float32, float64.
- **w** – A Tensor. Must have the same type as x.
- **nbitx** – An int.
- **nbitw** – An int.
- **normw** – An int.

- **name** – A name for the operation (optional).

Returns

A Tensor. Has the same type as x.

`deepmd.env.op_module.MatmulFlt2fixNvnmd(x, w, nbit, name=None)`

TODO: add doc.

Parameters

- **x** – A Tensor. Must be one of the following types: float32, float64.
- **w** – A Tensor. Must have the same type as x.
- **nbit** – An int.
- **name** – A name for the operation (optional).

Returns

A Tensor. Has the same type as x.

`deepmd.env.op_module.MatmulFltNvnmd(x, w, normx, normw, name=None)`

TODO: add doc.

Parameters

- **x** – A Tensor. Must be one of the following types: float32, float64.
- **w** – A Tensor. Must have the same type as x.
- **normx** – An int.
- **normw** – An int.
- **name** – A name for the operation (optional).

Returns

A Tensor. Has the same type as x.

`deepmd.env.op_module.MulFltNvnmd(x, w, name=None)`

TODO: add doc.

Parameters

- **x** – A Tensor. Must be one of the following types: float32, float64.
- **w** – A Tensor. Must have the same type as x.
- **name** – A name for the operation (optional).

Returns

A Tensor. Has the same type as x.

`deepmd.env.op_module.NeighborStat(coord, type, natoms, box, mesh, rcut, name=None)`

TODO: add doc.

Parameters

- **coord** – A Tensor. Must be one of the following types: float32, float64.
- **type** – A Tensor of type int32.
- **natoms** – A Tensor of type int32.
- **box** – A Tensor. Must have the same type as coord.
- **mesh** – A Tensor of type int32.

- **rcut** – A float.
- **name** – A name for the operation (optional).

Returns

A tuple of Tensor objects (max_nbor_size, min_nbor_dist).

max_nbor_size: A Tensor of type int32. min_nbor_dist: A Tensor. Has the same type as coord.

```
deepmd.env.op_module.PairTab(table_info, table_data, type, rij, nlist, natoms, scale, sel_a, sel_r,  
                             name=None)
```

TODO: add doc.

Parameters

- **table_info** – A Tensor of type float64.
- **table_data** – A Tensor of type float64.
- **type** – A Tensor of type int32.
- **rij** – A Tensor. Must be one of the following types: float32, float64.
- **nlist** – A Tensor of type int32.
- **natoms** – A Tensor of type int32.
- **scale** – A Tensor. Must have the same type as rij.
- **sel_a** – A list of ints.
- **sel_r** – A list of ints.
- **name** – A name for the operation (optional).

Returns

A tuple of Tensor objects (atom_energy, force, atom_virial).

atom_energy: A Tensor. Has the same type as rij. force: A Tensor. Has the same type as rij. atom_virial: A Tensor. Has the same type as rij.

```
deepmd.env.op_module.ParallelProdForceSeA(net_deriv, in_deriv, nlist, natoms, n_a_sel, n_r_sel,  
                                           parallel=False, start_frac=0, end_frac=1, name=None)
```

TODO: add doc.

Parameters

- **net_deriv** – A Tensor. Must be one of the following types: float32, float64.
- **in_deriv** – A Tensor. Must have the same type as net_deriv.
- **nlist** – A Tensor of type int32.
- **natoms** – A Tensor of type int32.
- **n_a_sel** – An int.
- **n_r_sel** – An int.
- **parallel** – An optional bool. Defaults to False.
- **start_frac** – An optional float. Defaults to 0.
- **end_frac** – An optional float. Defaults to 1.
- **name** – A name for the operation (optional).

Returns

A Tensor. Has the same type as `net_deriv`.

`deepmd.env.op_module.ProdEnvMatA(coord, type, natoms, box, mesh, davg, dstd, rcut_a, rcut_r, rcut_r_smth, sel_a, sel_r, name=None)`

Compute the environment matrix for descriptor `se_e2_a`.

Each row of the environment matrix \mathcal{R}^i can be constructed as follows

$$(\mathcal{R}^i)_j = \begin{bmatrix} \frac{s(r_{ji})}{s(r_{ji})x_{ji}} \\ \frac{r_{ji}^{j_i}}{s(r_{ji})y_{ji}} \\ \frac{r_{ji}^{j_i}}{s(r_{ji})z_{ji}} \end{bmatrix}$$

In the above equation, $\mathbf{R}_{ji} = \mathbf{R}_j - \mathbf{R}_i = (x_{ji}, y_{ji}, z_{ji})$ is the relative coordinate and $r_{ji} = \|\mathbf{R}_{ji}\|$ is its norm. The switching function $s(r)$ is defined as:

$$s(r) = \begin{cases} \frac{1}{r}, & r < r_s \\ \frac{1}{r} \left\{ \left(\frac{r-r_s}{r_c-r_s} \right)^3 \left(-6 \left(\frac{r-r_s}{r_c-r_s} \right)^2 + 15 \frac{r-r_s}{r_c-r_s} - 10 \right) + 1 \right\}, & r_s \leq r < r_c \\ 0, & r \geq r_c \end{cases}$$

Note that the environment matrix is normalized by `davg` and `dstd`.

Parameters

- **coord** – A Tensor. Must be one of the following types: float32, float64. The coordinates of atoms.
- **type** – A Tensor of type int32. The types of atoms.
- **natoms** – A Tensor of type int32. The number of atoms. This tensor has the length of `Ntypes + 2`. `natoms[0]`: number of local atoms. `natoms[1]`: total number of atoms held by this processor. `natoms[i]`: $2 \leq i < \text{Ntypes}+2$, number of type *i* atoms.
- **box** – A Tensor. Must have the same type as `coord`. The box of frames.
- **mesh** – A Tensor of type int32. For historical reasons, only the length of the Tensor matters. If size of `mesh` == 6, pbc is assumed. If size of `mesh` == 0, no-pbc is assumed.
- **davg** – A Tensor. Must have the same type as `coord`. Average value of the environment matrix for normalization.
- **dstd** – A Tensor. Must have the same type as `coord`. Standard deviation of the environment matrix for normalization.
- **rcut_a** – A float. This argument is not used.
- **rcut_r** – A float. The cutoff radius for the environment matrix.
- **rcut_r_smth** – A float. From where the environment matrix should be smoothed.
- **sel_a** – A list of ints. `sel_a[i]` specifies the maximum number of type *i* atoms in the cut-off radius.
- **sel_r** – A list of ints. This argument is not used.
- **name** – A name for the operation (optional).

Returns

A tuple of Tensor objects (descript, descript_deriv, rij, nlist).

descript: A Tensor. Has the same type as coord. The environment matrix. descript_deriv: A Tensor. Has the same type as coord. The derivative of the environment matrix. rij: A Tensor. Has the same type as coord. The distance between the atoms. nlist: A Tensor of type int32. The neighbor list of each atom.

```
deepmd.env.op_module.ProdEnvMatAMix(coord, type, natoms, box, mesh, davg, dstd, rcut_a, rcut_r,
                                     rcut_r_smth, sel_a, sel_r, name=None)
```

Compute the environment matrix mixing the atom types.

The sorting of neighbor atoms depends not on atom types, but on the distance and index. The atoms in nlist matrix will gather forward and thus save space for gaps of types in ProdEnvMatA, resulting in optimized and relative small sel_a.

The additional outputs are listed as following:

Parameters

- **coord** – A Tensor. Must be one of the following types: float32, float64.
- **type** – A Tensor of type int32.
- **natoms** – A Tensor of type int32.
- **box** – A Tensor. Must have the same type as coord.
- **mesh** – A Tensor of type int32.
- **davg** – A Tensor. Must have the same type as coord.
- **dstd** – A Tensor. Must have the same type as coord.
- **rcut_a** – A float.
- **rcut_r** – A float.
- **rcut_r_smth** – A float.
- **sel_a** – A list of ints.
- **sel_r** – A list of ints.
- **name** – A name for the operation (optional).

Returns

A tuple of Tensor objects (descript, descript_deriv, rij, nlist, ntype, nmask).

descript: A Tensor. Has the same type as coord. descript_deriv: A Tensor. Has the same type as coord. rij: A Tensor. Has the same type as coord. nlist: A Tensor of type int32. ntype: A Tensor of type int32. The corresponding atom types in nlist. nmask: A Tensor of type bool. The atom mask in nlist.

```
deepmd.env.op_module.ProdEnvMatANvnmQuantize(coord, type, natoms, box, mesh, davg, dstd, rcut_a,
                                              rcut_r, rcut_r_smth, sel_a, sel_r, name=None)
```

TODO: add doc.

Parameters

- **coord** – A Tensor. Must be one of the following types: float32, float64.
- **type** – A Tensor of type int32.
- **natoms** – A Tensor of type int32.

- **box** – A Tensor. Must have the same type as coord.
- **mesh** – A Tensor of type int32.
- **davg** – A Tensor. Must have the same type as coord.
- **dstd** – A Tensor. Must have the same type as coord.
- **rcut_a** – A float.
- **rcut_r** – A float.
- **rcut_r_smth** – A float.
- **sel_a** – A list of ints.
- **sel_r** – A list of ints.
- **name** – A name for the operation (optional).

Returns

A tuple of Tensor objects (descrpt, descrpt_deriv, rij, nlist).

descrpt: A Tensor. Has the same type as coord. descrpt_deriv: A Tensor. Has the same type as coord. rij: A Tensor. Has the same type as coord. nlist: A Tensor of type int32.

```
deepmd.env.op_module.ProdEnvMatR(coord, type, natoms, box, mesh, davg, dstd, rcut, rcut_smth, sel,
                                  name=None)
```

TODO: add doc.

Parameters

- **coord** – A Tensor. Must be one of the following types: float32, float64.
- **type** – A Tensor of type int32.
- **natoms** – A Tensor of type int32.
- **box** – A Tensor. Must have the same type as coord.
- **mesh** – A Tensor of type int32.
- **davg** – A Tensor. Must have the same type as coord.
- **dstd** – A Tensor. Must have the same type as coord.
- **rcut** – A float.
- **rcut_smth** – A float.
- **sel** – A list of ints.
- **name** – A name for the operation (optional).

Returns

A tuple of Tensor objects (descrpt, descrpt_deriv, rij, nlist).

descrpt: A Tensor. Has the same type as coord. descrpt_deriv: A Tensor. Has the same type as coord. rij: A Tensor. Has the same type as coord. nlist: A Tensor of type int32.

```
deepmd.env.op_module.ProdForce(net_deriv, in_deriv, nlist, axis, natoms, n_a_sel, n_r_sel, name=None)
```

TODO: add doc.

Parameters

- **net_deriv** – A Tensor. Must be one of the following types: float32, float64.

- **in_deriv** – A Tensor. Must have the same type as `net_deriv`.
- **nlist** – A Tensor of type `int32`.
- **axis** – A Tensor of type `int32`.
- **natoms** – A Tensor of type `int32`.
- **n_a_sel** – An int.
- **n_r_sel** – An int.
- **name** – A name for the operation (optional).

Returns

A Tensor. Has the same type as `net_deriv`.

```
deepmd.env.op_module.ProdForceNorot(net_deriv, in_deriv, nlist, natoms, n_a_sel, n_r_sel,
                                     name=None)
```

TODO: add doc.

Parameters

- **net_deriv** – A Tensor. Must be one of the following types: `float32`, `float64`.
- **in_deriv** – A Tensor. Must have the same type as `net_deriv`.
- **nlist** – A Tensor of type `int32`.
- **natoms** – A Tensor of type `int32`.
- **n_a_sel** – An int.
- **n_r_sel** – An int.
- **name** – A name for the operation (optional).

Returns

A Tensor. Has the same type as `net_deriv`.

```
deepmd.env.op_module.ProdForceSeA(net_deriv, in_deriv, nlist, natoms, n_a_sel, n_r_sel, name=None)
```

TODO: add doc.

Parameters

- **net_deriv** – A Tensor. Must be one of the following types: `float32`, `float64`.
- **in_deriv** – A Tensor. Must have the same type as `net_deriv`.
- **nlist** – A Tensor of type `int32`.
- **natoms** – A Tensor of type `int32`.
- **n_a_sel** – An int.
- **n_r_sel** – An int.
- **name** – A name for the operation (optional).

Returns

A Tensor. Has the same type as `net_deriv`.

```
deepmd.env.op_module.ProdForceSeAMask(net_deriv, in_deriv, mask, nlist, total_atom_num,
                                       name=None)
```

TODO: add doc.

Parameters

- **net_deriv** – A Tensor. Must be one of the following types: float32, float64.
- **in_deriv** – A Tensor. Must have the same type as net_deriv.
- **mask** – A Tensor of type int32.
- **nlist** – A Tensor of type int32.
- **total_atom_num** – An int.
- **name** – A name for the operation (optional).

Returns

A Tensor. Has the same type as net_deriv.

`deepmd.env.op_module.ProdForceSeR(net_deriv, in_deriv, nlist, natoms, name=None)`

TODO: add doc.

Parameters

- **net_deriv** – A Tensor. Must be one of the following types: float32, float64.
- **in_deriv** – A Tensor. Must have the same type as net_deriv.
- **nlist** – A Tensor of type int32.
- **natoms** – A Tensor of type int32.
- **name** – A name for the operation (optional).

Returns

A Tensor. Has the same type as net_deriv.

`deepmd.env.op_module.ProdVirial(net_deriv, in_deriv, rij, nlist, axis, natoms, n_a_sel, n_r_sel, name=None)`

TODO: add doc.

Parameters

- **net_deriv** – A Tensor. Must be one of the following types: float32, float64.
- **in_deriv** – A Tensor. Must have the same type as net_deriv.
- **rij** – A Tensor. Must have the same type as net_deriv.
- **nlist** – A Tensor of type int32.
- **axis** – A Tensor of type int32.
- **natoms** – A Tensor of type int32.
- **n_a_sel** – An int.
- **n_r_sel** – An int.
- **name** – A name for the operation (optional).

Returns

A tuple of Tensor objects (virial, atom_virial).

virial: A Tensor. Has the same type as net_deriv. atom_virial: A Tensor. Has the same type as net_deriv.

`deepmd.env.op_module.ProdVirialNorot(net_deriv, in_deriv, rij, nlist, natoms, n_a_sel, n_r_sel, name=None)`

TODO: add doc.

Parameters

- **net_deriv** – A Tensor. Must be one of the following types: float32, float64.
- **in_deriv** – A Tensor. Must have the same type as net_deriv.
- **rij** – A Tensor. Must have the same type as net_deriv.
- **nlist** – A Tensor of type int32.
- **natoms** – A Tensor of type int32.
- **n_a_sel** – An int.
- **n_r_sel** – An int.
- **name** – A name for the operation (optional).

Returns

A tuple of Tensor objects (virial, atom_virial).

virial: A Tensor. Has the same type as net_deriv. atom_virial: A Tensor. Has the same type as net_deriv.

```
deepmd.env.op_module.ProdVirialSeA(net_deriv, in_deriv, rij, nlist, natoms, n_a_sel, n_r_sel,
                                   name=None)
```

TODO: add doc.

Parameters

- **net_deriv** – A Tensor. Must be one of the following types: float32, float64.
- **in_deriv** – A Tensor. Must have the same type as net_deriv.
- **rij** – A Tensor. Must have the same type as net_deriv.
- **nlist** – A Tensor of type int32.
- **natoms** – A Tensor of type int32.
- **n_a_sel** – An int.
- **n_r_sel** – An int.
- **name** – A name for the operation (optional).

Returns

A tuple of Tensor objects (virial, atom_virial).

virial: A Tensor. Has the same type as net_deriv. atom_virial: A Tensor. Has the same type as net_deriv.

```
deepmd.env.op_module.ProdVirialSeR(net_deriv, in_deriv, rij, nlist, natoms, name=None)
```

TODO: add doc.

Parameters

- **net_deriv** – A Tensor. Must be one of the following types: float32, float64.
- **in_deriv** – A Tensor. Must have the same type as net_deriv.
- **rij** – A Tensor. Must have the same type as net_deriv.
- **nlist** – A Tensor of type int32.
- **natoms** – A Tensor of type int32.

- **name** – A name for the operation (optional).

Returns

A tuple of Tensor objects (virial, atom_virial).

virial: A Tensor. Has the same type as net_deriv. atom_virial: A Tensor. Has the same type as net_deriv.

`deepmd.env.op_module.QuantizeNvnmd(x, isround, nbit1, nbit2, nbit3, name=None)`

TODO: add doc.

Parameters

- **x** – A Tensor. Must be one of the following types: float32, float64.
- **isround** – An int.
- **nbit1** – An int.
- **nbit2** – An int.
- **nbit3** – An int.
- **name** – A name for the operation (optional).

Returns

A Tensor. Has the same type as x.

`deepmd.env.op_module.SoftMinForce(du, sw_deriv, nlist, natoms, n_a_sel, n_r_sel, name=None)`

TODO: add doc.

Parameters

- **du** – A Tensor. Must be one of the following types: float32, float64.
- **sw_deriv** – A Tensor. Must have the same type as du.
- **nlist** – A Tensor of type int32.
- **natoms** – A Tensor of type int32.
- **n_a_sel** – An int.
- **n_r_sel** – An int.
- **name** – A name for the operation (optional).

Returns

A Tensor. Has the same type as du.

`deepmd.env.op_module.SoftMinSwitch(type, rij, nlist, natoms, sel_a, sel_r, alpha, rmin, rmax, name=None)`

TODO: add doc.

Parameters

- **type** – A Tensor of type int32.
- **rij** – A Tensor. Must be one of the following types: float32, float64.
- **nlist** – A Tensor of type int32.
- **natoms** – A Tensor of type int32.
- **sel_a** – A list of ints.
- **sel_r** – A list of ints.

- **alpha** – A float.
- **rmin** – A float.
- **rmax** – A float.
- **name** – A name for the operation (optional).

Returns

A tuple of Tensor objects (sw_value, sw_deriv).

sw_value: A Tensor. Has the same type as rij. sw_deriv: A Tensor. Has the same type as rij.

`deepmd.env.op_module.SoftMinVirial(du, sw_deriv, rij, nlist, natoms, n_a_sel, n_r_sel, name=None)`

TODO: add doc.

Parameters

- **du** – A Tensor. Must be one of the following types: float32, float64.
- **sw_deriv** – A Tensor. Must have the same type as du.
- **rij** – A Tensor. Must have the same type as du.
- **nlist** – A Tensor of type int32.
- **natoms** – A Tensor of type int32.
- **n_a_sel** – An int.
- **n_r_sel** – An int.
- **name** – A name for the operation (optional).

Returns

A tuple of Tensor objects (virial, atom_virial).

virial: A Tensor. Has the same type as du. atom_virial: A Tensor. Has the same type as du.

`deepmd.env.op_module.TabulateFusion(table, table_info, em_x, em, last_layer_size, name=None)`

TODO: add doc.

Parameters

- **table** – A Tensor. Must be one of the following types: float32, float64.
- **table_info** – A Tensor. Must have the same type as table.
- **em_x** – A Tensor. Must have the same type as table.
- **em** – A Tensor. Must have the same type as table.
- **last_layer_size** – An int.
- **name** – A name for the operation (optional).

Returns

A Tensor. Has the same type as table.

`deepmd.env.op_module.TabulateFusionGrad(table, table_info, em_x, em, dy, descriptor, name=None)`

TODO: add doc.

Parameters

- **table** – A Tensor. Must be one of the following types: float32, float64.

- **table_info** – A Tensor. Must have the same type as table.
- **em_x** – A Tensor. Must have the same type as table.
- **em** – A Tensor. Must have the same type as table.
- **dy** – A Tensor. Must have the same type as table.
- **descriptor** – A Tensor. Must have the same type as table.
- **name** – A name for the operation (optional).

Returns

A tuple of Tensor objects (dy_dem_x, dy_dem).

dy_dem_x: A Tensor. Has the same type as table. dy_dem: A Tensor. Has the same type as table.

```
deepmd.env.op_module.TabulateFusionGradGrad(table, table_info, em_x, em, dz_dy_dem_x,
                                             dz_dy_dem, descriptor, name=None)
```

TODO: add doc.

Parameters

- **table** – A Tensor. Must be one of the following types: float32, float64.
- **table_info** – A Tensor. Must have the same type as table.
- **em_x** – A Tensor. Must have the same type as table.
- **em** – A Tensor. Must have the same type as table.
- **dz_dy_dem_x** – A Tensor. Must have the same type as table.
- **dz_dy_dem** – A Tensor. Must have the same type as table.
- **descriptor** – A Tensor. Must have the same type as table.
- **name** – A name for the operation (optional).

Returns

A Tensor. Has the same type as table.

```
deepmd.env.op_module.TabulateFusionSeA(table, table_info, em_x, em, last_layer_size, name=None)
```

TODO: add doc.

Parameters

- **table** – A Tensor. Must be one of the following types: float32, float64.
- **table_info** – A Tensor. Must have the same type as table.
- **em_x** – A Tensor. Must have the same type as table.
- **em** – A Tensor. Must have the same type as table.
- **last_layer_size** – An int.
- **name** – A name for the operation (optional).

Returns

A Tensor. Has the same type as table.

```
deepmd.env.op_module.TabulateFusionSeAGrad(table, table_info, em_x, em, dy, descriptor,
                                             name=None)
```

TODO: add doc.

Parameters

- **table** – A Tensor. Must be one of the following types: float32, float64.
- **table_info** – A Tensor. Must have the same type as table.
- **em_x** – A Tensor. Must have the same type as table.
- **em** – A Tensor. Must have the same type as table.
- **dy** – A Tensor. Must have the same type as table.
- **descriptor** – A Tensor. Must have the same type as table.
- **name** – A name for the operation (optional).

Returns

A tuple of Tensor objects (dy_dem_x, dy_dem).

dy_dem_x: A Tensor. Has the same type as table. dy_dem: A Tensor. Has the same type as table.

```
deepmd.env.op_module.TabulateFusionSeAGradGrad(table, table_info, em_x, em, dz_dy_dem_x,  
                                                dz_dy_dem, descriptor, name=None)
```

TODO: add doc.

Parameters

- **table** – A Tensor. Must be one of the following types: float32, float64.
- **table_info** – A Tensor. Must have the same type as table.
- **em_x** – A Tensor. Must have the same type as table.
- **em** – A Tensor. Must have the same type as table.
- **dz_dy_dem_x** – A Tensor. Must have the same type as table.
- **dz_dy_dem** – A Tensor. Must have the same type as table.
- **descriptor** – A Tensor. Must have the same type as table.
- **name** – A name for the operation (optional).

Returns

A Tensor. Has the same type as table.

```
deepmd.env.op_module.TabulateFusionSeR(table, table_info, em, last_layer_size, name=None)
```

TODO: add doc.

Parameters

- **table** – A Tensor. Must be one of the following types: float32, float64.
- **table_info** – A Tensor. Must have the same type as table.
- **em** – A Tensor. Must have the same type as table.
- **last_layer_size** – An int.
- **name** – A name for the operation (optional).

Returns

A Tensor. Has the same type as table.

`deepmd.env.op_module.TabulateFusionSeRGrad(table, table_info, em, dy, descriptor, name=None)`

TODO: add doc.

Parameters

- **table** – A Tensor. Must be one of the following types: float32, float64.
- **table_info** – A Tensor. Must have the same type as table.
- **em** – A Tensor. Must have the same type as table.
- **dy** – A Tensor. Must have the same type as table.
- **descriptor** – A Tensor. Must have the same type as table.
- **name** – A name for the operation (optional).

Returns

A Tensor. Has the same type as table.

`deepmd.env.op_module.TabulateFusionSeRGradGrad(table, table_info, em, dz_dy_dem, descriptor, name=None)`

TODO: add doc.

Parameters

- **table** – A Tensor. Must be one of the following types: float32, float64.
- **table_info** – A Tensor. Must have the same type as table.
- **em** – A Tensor. Must have the same type as table.
- **dz_dy_dem** – A Tensor. Must have the same type as table.
- **descriptor** – A Tensor. Must have the same type as table.
- **name** – A name for the operation (optional).

Returns

A Tensor. Has the same type as table.

`deepmd.env.op_module.TabulateFusionSeT(table, table_info, em_x, em, last_layer_size, name=None)`

TODO: add doc.

Parameters

- **table** – A Tensor. Must be one of the following types: float32, float64.
- **table_info** – A Tensor. Must have the same type as table.
- **em_x** – A Tensor. Must have the same type as table.
- **em** – A Tensor. Must have the same type as table.
- **last_layer_size** – An int.
- **name** – A name for the operation (optional).

Returns

A Tensor. Has the same type as table.

`deepmd.env.op_module.TabulateFusionSeTGrad(table, table_info, em_x, em, dy, descriptor, name=None)`

TODO: add doc.

Parameters

- **table** – A Tensor. Must be one of the following types: float32, float64.
- **table_info** – A Tensor. Must have the same type as table.
- **em_x** – A Tensor. Must have the same type as table.
- **em** – A Tensor. Must have the same type as table.
- **dy** – A Tensor. Must have the same type as table.
- **descriptor** – A Tensor. Must have the same type as table.
- **name** – A name for the operation (optional).

Returns

A tuple of Tensor objects (dy_dem_x, dy_dem).

dy_dem_x: A Tensor. Has the same type as table. dy_dem: A Tensor. Has the same type as table.

```
deepmd.env.op_module.TabulateFusionSeTGradGrad(table, table_info, em_x, em, dz_dy_dem_x,  
                                                dz_dy_dem, descriptor, name=None)
```

TODO: add doc.

Parameters

- **table** – A Tensor. Must be one of the following types: float32, float64.
- **table_info** – A Tensor. Must have the same type as table.
- **em_x** – A Tensor. Must have the same type as table.
- **em** – A Tensor. Must have the same type as table.
- **dz_dy_dem_x** – A Tensor. Must have the same type as table.
- **dz_dy_dem** – A Tensor. Must have the same type as table.
- **descriptor** – A Tensor. Must have the same type as table.
- **name** – A name for the operation (optional).

Returns

A Tensor. Has the same type as table.

```
deepmd.env.op_module.Tanh4FltNvnmd(x, name=None)
```

TODO: add doc.

Parameters

- **x** – A Tensor. Must be one of the following types: float32, float64.
- **name** – A name for the operation (optional).

Returns

A Tensor. Has the same type as x.

```
deepmd.env.op_module.UnaggregatedDy2Dx(z, w, dy_dx, dy2_dx, ybar, functype, name=None)
```

TODO: add doc.

Parameters

- **z** – A Tensor. Must be one of the following types: float32, float64.
- **w** – A Tensor. Must have the same type as z.
- **dy_dx** – A Tensor. Must have the same type as z.

- **dy2_dx** – A Tensor. Must have the same type as **z**.
- **ybar** – A Tensor. Must have the same type as **z**.
- **functype** – A Tensor of type int32.
- **name** – A name for the operation (optional).

Returns

A Tensor. Has the same type as **z**.

`deepmd.env.op_module.UnaggregatedDy2DxS(y, dy, w, xbar, functype, name=None)`

TODO: add doc.

Parameters

- **y** – A Tensor. Must be one of the following types: float32, float64.
- **dy** – A Tensor. Must have the same type as **y**.
- **w** – A Tensor. Must have the same type as **y**.
- **xbar** – A Tensor. Must have the same type as **y**.
- **functype** – A Tensor of type int32.
- **name** – A name for the operation (optional).

Returns

A Tensor. Has the same type as **y**.

`deepmd.env.op_module.UnaggregatedDyDx(z, w, dy_dx, ybar, functype, name=None)`

TODO: add doc.

Parameters

- **z** – A Tensor. Must be one of the following types: float32, float64.
- **w** – A Tensor. Must have the same type as **z**.
- **dy_dx** – A Tensor. Must have the same type as **z**.
- **ybar** – A Tensor. Must have the same type as **z**.
- **functype** – A Tensor of type int32.
- **name** – A name for the operation (optional).

Returns

A Tensor. Has the same type as **z**.

`deepmd.env.op_module.UnaggregatedDyDxS(y, w, xbar, functype, name=None)`

TODO: add doc.

Parameters

- **y** – A Tensor. Must be one of the following types: float32, float64.
- **w** – A Tensor. Must have the same type as **y**.
- **xbar** – A Tensor. Must have the same type as **y**.
- **functype** – A Tensor of type int32.
- **name** – A name for the operation (optional).

Returns

A Tensor. Has the same type as **y**.

`deepmd.env.op_module.add_flt_nvnmmd(x, w, name=None)`

TODO: add doc.

Parameters

- **x** – A Tensor. Must be one of the following types: float32, float64.
- **w** – A Tensor. Must have the same type as x.
- **name** – A name for the operation (optional).

Returns

A Tensor. Has the same type as x.

`deepmd.env.op_module.copy_flt_nvnmmd(x, name=None)`

TODO: add doc.

Parameters

- **x** – A Tensor. Must be one of the following types: float32, float64.
- **name** – A name for the operation (optional).

Returns

A tuple of Tensor objects (y1, y2).

y1: A Tensor. Has the same type as x. y2: A Tensor. Has the same type as x.

`deepmd.env.op_module.descrpt(coord, type, natoms, box, mesh, davg, dstd, rcut_a, rcut_r, sel_a, sel_r, axis_rule, name=None)`

TODO: add doc.

Parameters

- **coord** – A Tensor. Must be one of the following types: float32, float64.
- **type** – A Tensor of type int32.
- **natoms** – A Tensor of type int32.
- **box** – A Tensor. Must have the same type as coord.
- **mesh** – A Tensor of type int32.
- **davg** – A Tensor. Must have the same type as coord.
- **dstd** – A Tensor. Must have the same type as coord.
- **rcut_a** – A float.
- **rcut_r** – A float.
- **sel_a** – A list of ints.
- **sel_r** – A list of ints.
- **axis_rule** – A list of ints.
- **name** – A name for the operation (optional).

Returns

A tuple of Tensor objects (descrpt, descrpt_deriv, rij, nlist, axis, rot_mat).

descrpt: A Tensor. Has the same type as coord. descrpt_deriv: A Tensor. Has the same type as coord. rij: A Tensor. Has the same type as coord. nlist: A Tensor of type int32.

axis: A Tensor of type int32. rot_mat: A Tensor. Has the same type as coord.

```
deepmd.env.op_module.descript_norot(coord, type, natoms, box, mesh, davg, dstd, rcut_a, rcut_r,
                                     rcut_r_smth, sel_a, sel_r, name=None)
```

TODO: add doc.

Parameters

- **coord** – A Tensor. Must be one of the following types: float32, float64.
- **type** – A Tensor of type int32.
- **natoms** – A Tensor of type int32.
- **box** – A Tensor. Must have the same type as coord.
- **mesh** – A Tensor of type int32.
- **davg** – A Tensor. Must have the same type as coord.
- **dstd** – A Tensor. Must have the same type as coord.
- **rcut_a** – A float.
- **rcut_r** – A float.
- **rcut_r_smth** – A float.
- **sel_a** – A list of ints.
- **sel_r** – A list of ints.
- **name** – A name for the operation (optional).

Returns

A tuple of Tensor objects (descript, descript_deriv, rij, nlist).

descript: A Tensor. Has the same type as coord. descript_deriv: A Tensor. Has the same type as coord. rij: A Tensor. Has the same type as coord. nlist: A Tensor of type int32.

```
deepmd.env.op_module.descript_se_a(coord, type, natoms, box, mesh, davg, dstd, rcut_a, rcut_r,
                                    rcut_r_smth, sel_a, sel_r, name=None)
```

TODO: add doc.

Parameters

- **coord** – A Tensor. Must be one of the following types: float32, float64.
- **type** – A Tensor of type int32.
- **natoms** – A Tensor of type int32.
- **box** – A Tensor. Must have the same type as coord.
- **mesh** – A Tensor of type int32.
- **davg** – A Tensor. Must have the same type as coord.
- **dstd** – A Tensor. Must have the same type as coord.
- **rcut_a** – A float.
- **rcut_r** – A float.
- **rcut_r_smth** – A float.
- **sel_a** – A list of ints.
- **sel_r** – A list of ints.

- **name** – A name for the operation (optional).

Returns

A tuple of Tensor objects (descript, descript_deriv, rij, nlist).

descript: A Tensor. Has the same type as coord. descript_deriv: A Tensor. Has the same type as coord. rij: A Tensor. Has the same type as coord. nlist: A Tensor of type int32.

```
deepmd.env.op_module.descript_se_a_ef(coord, type, natoms, box, mesh, ef, davg, dstd, rcut_a, rcut_r, rcut_r_smth, sel_a, sel_r, name=None)
```

TODO: add doc.

Parameters

- **coord** – A Tensor. Must be one of the following types: float32, float64.
- **type** – A Tensor of type int32.
- **natoms** – A Tensor of type int32.
- **box** – A Tensor. Must have the same type as coord.
- **mesh** – A Tensor of type int32.
- **ef** – A Tensor. Must have the same type as coord.
- **davg** – A Tensor. Must have the same type as coord.
- **dstd** – A Tensor. Must have the same type as coord.
- **rcut_a** – A float.
- **rcut_r** – A float.
- **rcut_r_smth** – A float.
- **sel_a** – A list of ints.
- **sel_r** – A list of ints.
- **name** – A name for the operation (optional).

Returns

A tuple of Tensor objects (descript, descript_deriv, rij, nlist).

descript: A Tensor. Has the same type as coord. descript_deriv: A Tensor. Has the same type as coord. rij: A Tensor. Has the same type as coord. nlist: A Tensor of type int32.

```
deepmd.env.op_module.descript_se_a_ef_para(coord, type, natoms, box, mesh, ef, davg, dstd, rcut_a, rcut_r, rcut_r_smth, sel_a, sel_r, name=None)
```

TODO: add doc.

Parameters

- **coord** – A Tensor. Must be one of the following types: float32, float64.
- **type** – A Tensor of type int32.
- **natoms** – A Tensor of type int32.
- **box** – A Tensor. Must have the same type as coord.
- **mesh** – A Tensor of type int32.
- **ef** – A Tensor. Must have the same type as coord.
- **davg** – A Tensor. Must have the same type as coord.

- **dstd** – A Tensor. Must have the same type as coord.
- **rcut_a** – A float.
- **rcut_r** – A float.
- **rcut_r_smth** – A float.
- **sel_a** – A list of ints.
- **sel_r** – A list of ints.
- **name** – A name for the operation (optional).

Returns

A tuple of Tensor objects (descript, descript_deriv, rij, nlist).

descript: A Tensor. Has the same type as coord. descript_deriv: A Tensor. Has the same type as coord. rij: A Tensor. Has the same type as coord. nlist: A Tensor of type int32.

`deepmd.env.op_module.descript_se_a_ef_vert(coord, type, natoms, box, mesh, ef, davg, dstd, rcut_a, rcut_r, rcut_r_smth, sel_a, sel_r, name=None)`

TODO: add doc.

Parameters

- **coord** – A Tensor. Must be one of the following types: float32, float64.
- **type** – A Tensor of type int32.
- **natoms** – A Tensor of type int32.
- **box** – A Tensor. Must have the same type as coord.
- **mesh** – A Tensor of type int32.
- **ef** – A Tensor. Must have the same type as coord.
- **davg** – A Tensor. Must have the same type as coord.
- **dstd** – A Tensor. Must have the same type as coord.
- **rcut_a** – A float.
- **rcut_r** – A float.
- **rcut_r_smth** – A float.
- **sel_a** – A list of ints.
- **sel_r** – A list of ints.
- **name** – A name for the operation (optional).

Returns

A tuple of Tensor objects (descript, descript_deriv, rij, nlist).

descript: A Tensor. Has the same type as coord. descript_deriv: A Tensor. Has the same type as coord. rij: A Tensor. Has the same type as coord. nlist: A Tensor of type int32.

`deepmd.env.op_module.descript_se_a_mask(coord, type, mask, box, natoms, mesh, name=None)`

TODO: add doc.

Parameters

- **coord** – A Tensor. Must be one of the following types: float32, float64.

- **type** – A Tensor of type int32.
- **mask** – A Tensor of type int32.
- **box** – A Tensor. Must have the same type as coord.
- **natoms** – A Tensor of type int32.
- **mesh** – A Tensor of type int32.
- **name** – A name for the operation (optional).

Returns

A tuple of Tensor objects (descrpt, descrpt_deriv, rij, nlist).

descrpt: A Tensor. Has the same type as coord. descrpt_deriv: A Tensor. Has the same type as coord. rij: A Tensor. Has the same type as coord. nlist: A Tensor of type int32.

```
deepmd.env.op_module.descrpt_se_r(coord, type, natoms, box, mesh, davg, dstd, rcut, rcut_smth, sel,
                                   name=None)
```

TODO: add doc.

Parameters

- **coord** – A Tensor. Must be one of the following types: float32, float64.
- **type** – A Tensor of type int32.
- **natoms** – A Tensor of type int32.
- **box** – A Tensor. Must have the same type as coord.
- **mesh** – A Tensor of type int32.
- **davg** – A Tensor. Must have the same type as coord.
- **dstd** – A Tensor. Must have the same type as coord.
- **rcut** – A float.
- **rcut_smth** – A float.
- **sel** – A list of ints.
- **name** – A name for the operation (optional).

Returns

A tuple of Tensor objects (descrpt, descrpt_deriv, rij, nlist).

descrpt: A Tensor. Has the same type as coord. descrpt_deriv: A Tensor. Has the same type as coord. rij: A Tensor. Has the same type as coord. nlist: A Tensor of type int32.

```
deepmd.env.op_module.dotmul_flt_nvnm(x, w, name=None)
```

TODO: add doc.

Parameters

- **x** – A Tensor. Must be one of the following types: float32, float64.
- **w** – A Tensor. Must have the same type as x.
- **name** – A name for the operation (optional).

Returns

A Tensor. Has the same type as x.

`deepmd.env.op_module.ewald_recip(coord, charge, natoms, box, ewald_beta, ewald_h, name=None)`

TODO: add doc.

Parameters

- **coord** – A Tensor. Must be one of the following types: float32, float64.
- **charge** – A Tensor. Must have the same type as coord.
- **natoms** – A Tensor of type int32.
- **box** – A Tensor. Must have the same type as coord.
- **ewald_beta** – A float.
- **ewald_h** – A float.
- **name** – A name for the operation (optional).

Returns

A tuple of Tensor objects (energy, force, virial).

energy: A Tensor. Has the same type as coord. force: A Tensor. Has the same type as coord. virial: A Tensor. Has the same type as coord.

`deepmd.env.op_module.flt_nvnmmd(x, name=None)`

TODO: add doc.

Parameters

- **x** – A Tensor. Must be one of the following types: float32, float64.
- **name** – A name for the operation (optional).

Returns

A Tensor. Has the same type as x.

`deepmd.env.op_module.gelu(x, name=None)`

TODO: add doc.

Parameters

- **x** – A Tensor. Must be one of the following types: float32, float64.
- **name** – A name for the operation (optional).

Returns

A Tensor. Has the same type as x.

`deepmd.env.op_module.gelu_custom(x, name=None)`

TODO: add doc.

Parameters

- **x** – A Tensor. Must be one of the following types: float32, float64.
- **name** – A name for the operation (optional).

Returns

A Tensor. Has the same type as x.

`deepmd.env.op_module.gelu_grad(dy, x, name=None)`

TODO: add doc.

Parameters

- **dy** – A Tensor. Must be one of the following types: float32, float64.
- **x** – A Tensor. Must have the same type as dy.
- **name** – A name for the operation (optional).

Returns

A Tensor. Has the same type as dy.

`deepmd.env.op_module.gelu_grad_custom(dy, x, name=None)`

TODO: add doc.

Parameters

- **dy** – A Tensor. Must be one of the following types: float32, float64.
- **x** – A Tensor. Must have the same type as dy.
- **name** – A name for the operation (optional).

Returns

A Tensor. Has the same type as dy.

`deepmd.env.op_module.gelu_grad_grad(dy, dy_, x, name=None)`

TODO: add doc.

Parameters

- **dy** – A Tensor. Must be one of the following types: float32, float64.
- **dy_** – A Tensor. Must have the same type as dy.
- **x** – A Tensor. Must have the same type as dy.
- **name** – A name for the operation (optional).

Returns

A Tensor. Has the same type as dy.

`deepmd.env.op_module.gelu_grad_grad_custom(dy, dy_, x, name=None)`

TODO: add doc.

Parameters

- **dy** – A Tensor. Must be one of the following types: float32, float64.
- **dy_** – A Tensor. Must have the same type as dy.
- **x** – A Tensor. Must have the same type as dy.
- **name** – A name for the operation (optional).

Returns

A Tensor. Has the same type as dy.

`deepmd.env.op_module.map_aparam(aparam, nlist, natoms, n_a_sel, n_r_sel, name=None)`

TODO: add doc.

Parameters

- **aparam** – A Tensor. Must be one of the following types: float32, float64.
- **nlist** – A Tensor of type int32.
- **natoms** – A Tensor of type int32.
- **n_a_sel** – An int.

- **n_r_sel** – An int.
- **name** – A name for the operation (optional).

Returns

A Tensor. Has the same type as aparam.

`deepmd.env.op_module.map_flt_nvnmd(x, table, table_grad, table_info, name=None)`

TODO: add doc.

Parameters

- **x** – A Tensor. Must be one of the following types: float32, float64.
- **table** – A Tensor. Must have the same type as x.
- **table_grad** – A Tensor. Must have the same type as x.
- **table_info** – A Tensor. Must have the same type as x.
- **name** – A name for the operation (optional).

Returns

A Tensor. Has the same type as x.

`deepmd.env.op_module.matmul_fitnet_nvnmd(x, w, nbitx, nbitw, normw, name=None)`

TODO: add doc.

Parameters

- **x** – A Tensor. Must be one of the following types: float32, float64.
- **w** – A Tensor. Must have the same type as x.
- **nbitx** – An int.
- **nbitw** – An int.
- **normw** – An int.
- **name** – A name for the operation (optional).

Returns

A Tensor. Has the same type as x.

`deepmd.env.op_module.matmul_flt2fix_nvnmd(x, w, nbit, name=None)`

TODO: add doc.

Parameters

- **x** – A Tensor. Must be one of the following types: float32, float64.
- **w** – A Tensor. Must have the same type as x.
- **nbit** – An int.
- **name** – A name for the operation (optional).

Returns

A Tensor. Has the same type as x.

`deepmd.env.op_module.matmul_flt_nvnmd(x, w, normx, normw, name=None)`

TODO: add doc.

Parameters

- **x** – A Tensor. Must be one of the following types: float32, float64.

- **w** – A Tensor. Must have the same type as **x**.
- **normx** – An int.
- **normw** – An int.
- **name** – A name for the operation (optional).

Returns

A Tensor. Has the same type as **x**.

```
deepmd.env.op_module.mul_flt_nvnm(x, w, name=None)
```

TODO: add doc.

Parameters

- **x** – A Tensor. Must be one of the following types: float32, float64.
- **w** – A Tensor. Must have the same type as **x**.
- **name** – A name for the operation (optional).

Returns

A Tensor. Has the same type as **x**.

```
deepmd.env.op_module.neighbor_stat(coord, type, natoms, box, mesh, rcut, name=None)
```

TODO: add doc.

Parameters

- **coord** – A Tensor. Must be one of the following types: float32, float64.
- **type** – A Tensor of type int32.
- **natoms** – A Tensor of type int32.
- **box** – A Tensor. Must have the same type as **coord**.
- **mesh** – A Tensor of type int32.
- **rcut** – A float.
- **name** – A name for the operation (optional).

Returns

A tuple of Tensor objects (max_nbor_size, min_nbor_dist).

max_nbor_size: A Tensor of type int32. min_nbor_dist: A Tensor. Has the same type as **coord**.

```
deepmd.env.op_module.pair_tab(table_info, table_data, type, rij, nlist, natoms, scale, sel_a, sel_r,  
                               name=None)
```

TODO: add doc.

Parameters

- **table_info** – A Tensor of type float64.
- **table_data** – A Tensor of type float64.
- **type** – A Tensor of type int32.
- **rij** – A Tensor. Must be one of the following types: float32, float64.
- **nlist** – A Tensor of type int32.
- **natoms** – A Tensor of type int32.

- **scale** – A Tensor. Must have the same type as rij.
- **sel_a** – A list of ints.
- **sel_r** – A list of ints.
- **name** – A name for the operation (optional).

Returns

A tuple of Tensor objects (atom_energy, force, atom_virial).

atom_energy: A Tensor. Has the same type as rij. force: A Tensor. Has the same type as rij. atom_virial: A Tensor. Has the same type as rij.

```
deepmd.env.op_module.parallel_prod_force_se_a(net_deriv, in_deriv, nlist, natoms, n_a_sel, n_r_sel,
                                              parallel=False, start_frac=0, end_frac=1,
                                              name=None)
```

TODO: add doc.

Parameters

- **net_deriv** – A Tensor. Must be one of the following types: float32, float64.
- **in_deriv** – A Tensor. Must have the same type as net_deriv.
- **nlist** – A Tensor of type int32.
- **natoms** – A Tensor of type int32.
- **n_a_sel** – An int.
- **n_r_sel** – An int.
- **parallel** – An optional bool. Defaults to False.
- **start_frac** – An optional float. Defaults to 0.
- **end_frac** – An optional float. Defaults to 1.
- **name** – A name for the operation (optional).

Returns

A Tensor. Has the same type as net_deriv.

```
deepmd.env.op_module.prod_env_mat_a(coord, type, natoms, box, mesh, davg, dstd, rcut_a, rcut_r,
                                     rcut_r_smth, sel_a, sel_r, name=None)
```

Compute the environment matrix for descriptor se_e2_a.

Each row of the environment matrix \mathcal{R}^i can be constructed as follows

$$(\mathcal{R}^i)_j = \begin{bmatrix} \frac{s(r_{ji})}{r_{ji}} \\ \frac{s(r_{ji})x_{ji}}{r_{ji}^2} \\ \frac{s(r_{ji})y_{ji}}{r_{ji}^2} \\ \frac{s(r_{ji})z_{ji}}{r_{ji}^2} \end{bmatrix}$$

In the above equation, $\mathbf{R}_{ji} = \mathbf{R}_j - \mathbf{R}_i = (x_{ji}, y_{ji}, z_{ji})$ is the relative coordinate and $r_{ji} = \|\mathbf{R}_{ji}\|$ is its norm. The switching function $s(r)$ is defined as:

$$s(r) = \begin{cases} \frac{1}{r}, & r < r_s \\ \frac{1}{r} \left\{ \left(\frac{r-r_s}{r_c-r_s} \right)^3 \left(-6 \left(\frac{r-r_s}{r_c-r_s} \right)^2 + 15 \frac{r-r_s}{r_c-r_s} - 10 \right) + 1 \right\}, & r_s \leq r < r_c \\ 0, & r \geq r_c \end{cases}$$

Note that the environment matrix is normalized by `davg` and `dstd`.

Parameters

- **coord** – A Tensor. Must be one of the following types: float32, float64. The coordinates of atoms.
- **type** – A Tensor of type int32. The types of atoms.
- **natoms** – A Tensor of type int32. The number of atoms. This tensor has the length of `Ntypes + 2`. `natoms[0]`: number of local atoms. `natoms[1]`: total number of atoms held by this processor. `natoms[i]`: $2 \leq i < Ntypes+2$, number of type *i* atoms.
- **box** – A Tensor. Must have the same type as `coord`. The box of frames.
- **mesh** – A Tensor of type int32. For historical reasons, only the length of the Tensor matters. If size of `mesh` == 6, pbc is assumed. If size of `mesh` == 0, no-pbc is assumed.
- **davg** – A Tensor. Must have the same type as `coord`. Average value of the environment matrix for normalization.
- **dstd** – A Tensor. Must have the same type as `coord`. Standard deviation of the environment matrix for normalization.
- **rcut_a** – A float. This argument is not used.
- **rcut_r** – A float. The cutoff radius for the environment matrix.
- **rcut_r_smth** – A float. From where the environment matrix should be smoothed.
- **sel_a** – A list of ints. `sel_a[i]` specifies the maximum number of type *i* atoms in the cut-off radius.
- **sel_r** – A list of ints. This argument is not used.
- **name** – A name for the operation (optional).

Returns

A tuple of Tensor objects (`descrpt`, `descrpt_deriv`, `rij`, `nlist`).

`descrpt`: A Tensor. Has the same type as `coord`. The environment matrix. `descrpt_deriv`: A Tensor. Has the same type as `coord`. The derivative of the environment matrix. `rij`: A Tensor. Has the same type as `coord`. The distance between the atoms. `nlist`: A Tensor of type int32. The neighbor list of each atom.

```
deepmd.env.op_module.prod_env_mat_a_mix(coord, type, natoms, box, mesh, davg, dstd, rcut_a, rcut_r,
                                         rcut_r_smth, sel_a, sel_r, name=None)
```

Compute the environment matrix mixing the atom types.

The sorting of neighbor atoms depends not on atom types, but on the distance and index. The atoms in `nlist` matrix will gather forward and thus save space for gaps of types in `ProdEnvMatA`, resulting in optimized and relative small `sel_a`.

The additional outputs are listed as following:

Parameters

- **coord** – A Tensor. Must be one of the following types: float32, float64.
- **type** – A Tensor of type int32.
- **natoms** – A Tensor of type int32.
- **box** – A Tensor. Must have the same type as coord.
- **mesh** – A Tensor of type int32.
- **davg** – A Tensor. Must have the same type as coord.
- **dstd** – A Tensor. Must have the same type as coord.
- **rcut_a** – A float.
- **rcut_r** – A float.
- **rcut_r_smth** – A float.
- **sel_a** – A list of ints.
- **sel_r** – A list of ints.
- **name** – A name for the operation (optional).

Returns

A tuple of Tensor objects (descript, descript_deriv, rij, nlist, ntype, nmask).

descript: A Tensor. Has the same type as coord. descript_deriv: A Tensor. Has the same type as coord. rij: A Tensor. Has the same type as coord. nlist: A Tensor of type int32. ntype: A Tensor of type int32. The corresponding atom types in nlist. nmask: A Tensor of type bool. The atom mask in nlist.

```
deepmd.env.op_module.prod_env_mat_a_nvnmmd_quantize(coord, type, natoms, box, mesh, davg, dstd,
                                                    rcut_a, rcut_r, rcut_r_smth, sel_a, sel_r,
                                                    name=None)
```

TODO: add doc.

Parameters

- **coord** – A Tensor. Must be one of the following types: float32, float64.
- **type** – A Tensor of type int32.
- **natoms** – A Tensor of type int32.
- **box** – A Tensor. Must have the same type as coord.
- **mesh** – A Tensor of type int32.
- **davg** – A Tensor. Must have the same type as coord.
- **dstd** – A Tensor. Must have the same type as coord.
- **rcut_a** – A float.
- **rcut_r** – A float.
- **rcut_r_smth** – A float.
- **sel_a** – A list of ints.
- **sel_r** – A list of ints.
- **name** – A name for the operation (optional).

Returns

A tuple of Tensor objects (descript, descript_deriv, rij, nlist).

descript: A Tensor. Has the same type as coord. descript_deriv: A Tensor. Has the same type as coord. rij: A Tensor. Has the same type as coord. nlist: A Tensor of type int32.

```
deepmd.env.op_module.prod_env_mat_r(coord, type, natoms, box, mesh, davg, dstd, rcut, rcut_smth, sel,
                                     name=None)
```

TODO: add doc.

Parameters

- **coord** – A Tensor. Must be one of the following types: float32, float64.
- **type** – A Tensor of type int32.
- **natoms** – A Tensor of type int32.
- **box** – A Tensor. Must have the same type as coord.
- **mesh** – A Tensor of type int32.
- **davg** – A Tensor. Must have the same type as coord.
- **dstd** – A Tensor. Must have the same type as coord.
- **rcut** – A float.
- **rcut_smth** – A float.
- **sel** – A list of ints.
- **name** – A name for the operation (optional).

Returns

A tuple of Tensor objects (descript, descript_deriv, rij, nlist).

descript: A Tensor. Has the same type as coord. descript_deriv: A Tensor. Has the same type as coord. rij: A Tensor. Has the same type as coord. nlist: A Tensor of type int32.

```
deepmd.env.op_module.prod_force(net_deriv, in_deriv, nlist, axis, natoms, n_a_sel, n_r_sel,
                                name=None)
```

TODO: add doc.

Parameters

- **net_deriv** – A Tensor. Must be one of the following types: float32, float64.
- **in_deriv** – A Tensor. Must have the same type as net_deriv.
- **nlist** – A Tensor of type int32.
- **axis** – A Tensor of type int32.
- **natoms** – A Tensor of type int32.
- **n_a_sel** – An int.
- **n_r_sel** – An int.
- **name** – A name for the operation (optional).

Returns

A Tensor. Has the same type as net_deriv.

```
deepmd.env.op_module.prod_force_norot(net_deriv, in_deriv, nlist, natoms, n_a_sel, n_r_sel,
                                     name=None)
```

TODO: add doc.

Parameters

- **net_deriv** – A Tensor. Must be one of the following types: float32, float64.
- **in_deriv** – A Tensor. Must have the same type as net_deriv.
- **nlist** – A Tensor of type int32.
- **natoms** – A Tensor of type int32.
- **n_a_sel** – An int.
- **n_r_sel** – An int.
- **name** – A name for the operation (optional).

Returns

A Tensor. Has the same type as net_deriv.

```
deepmd.env.op_module.prod_force_se_a(net_deriv, in_deriv, nlist, natoms, n_a_sel, n_r_sel,
                                     name=None)
```

TODO: add doc.

Parameters

- **net_deriv** – A Tensor. Must be one of the following types: float32, float64.
- **in_deriv** – A Tensor. Must have the same type as net_deriv.
- **nlist** – A Tensor of type int32.
- **natoms** – A Tensor of type int32.
- **n_a_sel** – An int.
- **n_r_sel** – An int.
- **name** – A name for the operation (optional).

Returns

A Tensor. Has the same type as net_deriv.

```
deepmd.env.op_module.prod_force_se_a_mask(net_deriv, in_deriv, mask, nlist, total_atom_num,
                                           name=None)
```

TODO: add doc.

Parameters

- **net_deriv** – A Tensor. Must be one of the following types: float32, float64.
- **in_deriv** – A Tensor. Must have the same type as net_deriv.
- **mask** – A Tensor of type int32.
- **nlist** – A Tensor of type int32.
- **total_atom_num** – An int.
- **name** – A name for the operation (optional).

Returns

A Tensor. Has the same type as net_deriv.

`deepmd.env.op_module.prod_force_se_r(net_deriv, in_deriv, nlist, natoms, name=None)`

TODO: add doc.

Parameters

- **net_deriv** – A Tensor. Must be one of the following types: float32, float64.
- **in_deriv** – A Tensor. Must have the same type as net_deriv.
- **nlist** – A Tensor of type int32.
- **natoms** – A Tensor of type int32.
- **name** – A name for the operation (optional).

Returns

A Tensor. Has the same type as net_deriv.

`deepmd.env.op_module.prod_virial(net_deriv, in_deriv, rij, nlist, axis, natoms, n_a_sel, n_r_sel, name=None)`

TODO: add doc.

Parameters

- **net_deriv** – A Tensor. Must be one of the following types: float32, float64.
- **in_deriv** – A Tensor. Must have the same type as net_deriv.
- **rij** – A Tensor. Must have the same type as net_deriv.
- **nlist** – A Tensor of type int32.
- **axis** – A Tensor of type int32.
- **natoms** – A Tensor of type int32.
- **n_a_sel** – An int.
- **n_r_sel** – An int.
- **name** – A name for the operation (optional).

Returns

A tuple of Tensor objects (virial, atom_virial).

virial: A Tensor. Has the same type as net_deriv. atom_virial: A Tensor. Has the same type as net_deriv.

`deepmd.env.op_module.prod_virial_norot(net_deriv, in_deriv, rij, nlist, natoms, n_a_sel, n_r_sel, name=None)`

TODO: add doc.

Parameters

- **net_deriv** – A Tensor. Must be one of the following types: float32, float64.
- **in_deriv** – A Tensor. Must have the same type as net_deriv.
- **rij** – A Tensor. Must have the same type as net_deriv.
- **nlist** – A Tensor of type int32.
- **natoms** – A Tensor of type int32.
- **n_a_sel** – An int.
- **n_r_sel** – An int.

- **name** – A name for the operation (optional).

Returns

A tuple of Tensor objects (virial, atom_virial).

virial: A Tensor. Has the same type as net_deriv. atom_virial: A Tensor. Has the same type as net_deriv.

```
deepmd.env.op_module.prod_virial_se_a(net_deriv, in_deriv, rij, nlist, natoms, n_a_sel, n_r_sel,
                                     name=None)
```

TODO: add doc.

Parameters

- **net_deriv** – A Tensor. Must be one of the following types: float32, float64.
- **in_deriv** – A Tensor. Must have the same type as net_deriv.
- **rij** – A Tensor. Must have the same type as net_deriv.
- **nlist** – A Tensor of type int32.
- **natoms** – A Tensor of type int32.
- **n_a_sel** – An int.
- **n_r_sel** – An int.
- **name** – A name for the operation (optional).

Returns

A tuple of Tensor objects (virial, atom_virial).

virial: A Tensor. Has the same type as net_deriv. atom_virial: A Tensor. Has the same type as net_deriv.

```
deepmd.env.op_module.prod_virial_se_r(net_deriv, in_deriv, rij, nlist, natoms, name=None)
```

TODO: add doc.

Parameters

- **net_deriv** – A Tensor. Must be one of the following types: float32, float64.
- **in_deriv** – A Tensor. Must have the same type as net_deriv.
- **rij** – A Tensor. Must have the same type as net_deriv.
- **nlist** – A Tensor of type int32.
- **natoms** – A Tensor of type int32.
- **name** – A name for the operation (optional).

Returns

A tuple of Tensor objects (virial, atom_virial).

virial: A Tensor. Has the same type as net_deriv. atom_virial: A Tensor. Has the same type as net_deriv.

```
deepmd.env.op_module.quantize_nvnmmd(x, isround, nbit1, nbit2, nbit3, name=None)
```

TODO: add doc.

Parameters

- **x** – A Tensor. Must be one of the following types: float32, float64.

- **isround** – An int.
- **nbit1** – An int.
- **nbit2** – An int.
- **nbit3** – An int.
- **name** – A name for the operation (optional).

Returns

A Tensor. Has the same type as x.

`deepmd.env.op_module.soft_min_force(du, sw_deriv, nlist, natoms, n_a_sel, n_r_sel, name=None)`

TODO: add doc.

Parameters

- **du** – A Tensor. Must be one of the following types: float32, float64.
- **sw_deriv** – A Tensor. Must have the same type as du.
- **nlist** – A Tensor of type int32.
- **natoms** – A Tensor of type int32.
- **n_a_sel** – An int.
- **n_r_sel** – An int.
- **name** – A name for the operation (optional).

Returns

A Tensor. Has the same type as du.

`deepmd.env.op_module.soft_min_switch(type, rij, nlist, natoms, sel_a, sel_r, alpha, rmin, rmax, name=None)`

TODO: add doc.

Parameters

- **type** – A Tensor of type int32.
- **rij** – A Tensor. Must be one of the following types: float32, float64.
- **nlist** – A Tensor of type int32.
- **natoms** – A Tensor of type int32.
- **sel_a** – A list of ints.
- **sel_r** – A list of ints.
- **alpha** – A float.
- **rmin** – A float.
- **rmax** – A float.
- **name** – A name for the operation (optional).

Returns

A tuple of Tensor objects (sw_value, sw_deriv).

sw_value: A Tensor. Has the same type as rij. sw_deriv: A Tensor. Has the same type as rij.

`deepmd.env.op_module.soft_min_virial(du, sw_deriv, rij, nlist, natoms, n_a_sel, n_r_sel, name=None)`

TODO: add doc.

Parameters

- **du** – A Tensor. Must be one of the following types: float32, float64.
- **sw_deriv** – A Tensor. Must have the same type as du.
- **rij** – A Tensor. Must have the same type as du.
- **nlist** – A Tensor of type int32.
- **natoms** – A Tensor of type int32.
- **n_a_sel** – An int.
- **n_r_sel** – An int.
- **name** – A name for the operation (optional).

Returns

A tuple of Tensor objects (virial, atom_virial).

virial: A Tensor. Has the same type as du. atom_virial: A Tensor. Has the same type as du.

`deepmd.env.op_module.tabulate_fusion(table, table_info, em_x, em, last_layer_size, name=None)`

TODO: add doc.

Parameters

- **table** – A Tensor. Must be one of the following types: float32, float64.
- **table_info** – A Tensor. Must have the same type as table.
- **em_x** – A Tensor. Must have the same type as table.
- **em** – A Tensor. Must have the same type as table.
- **last_layer_size** – An int.
- **name** – A name for the operation (optional).

Returns

A Tensor. Has the same type as table.

`deepmd.env.op_module.tabulate_fusion_grad(table, table_info, em_x, em, dy, descriptor, name=None)`

TODO: add doc.

Parameters

- **table** – A Tensor. Must be one of the following types: float32, float64.
- **table_info** – A Tensor. Must have the same type as table.
- **em_x** – A Tensor. Must have the same type as table.
- **em** – A Tensor. Must have the same type as table.
- **dy** – A Tensor. Must have the same type as table.
- **descriptor** – A Tensor. Must have the same type as table.
- **name** – A name for the operation (optional).

Returns

A tuple of Tensor objects (dy_dem_x, dy_dem).

dy_dem_x: A Tensor. Has the same type as table. dy_dem: A Tensor. Has the same type as table.

```
deepmd.env.op_module.tabulate_fusion_grad_grad(table, table_info, em_x, em, dz_dy_dem_x,
                                              dz_dy_dem, descriptor, name=None)
```

TODO: add doc.

Parameters

- **table** – A Tensor. Must be one of the following types: float32, float64.
- **table_info** – A Tensor. Must have the same type as table.
- **em_x** – A Tensor. Must have the same type as table.
- **em** – A Tensor. Must have the same type as table.
- **dz_dy_dem_x** – A Tensor. Must have the same type as table.
- **dz_dy_dem** – A Tensor. Must have the same type as table.
- **descriptor** – A Tensor. Must have the same type as table.
- **name** – A name for the operation (optional).

Returns

A Tensor. Has the same type as table.

```
deepmd.env.op_module.tabulate_fusion_se_a(table, table_info, em_x, em, last_layer_size,
                                          name=None)
```

TODO: add doc.

Parameters

- **table** – A Tensor. Must be one of the following types: float32, float64.
- **table_info** – A Tensor. Must have the same type as table.
- **em_x** – A Tensor. Must have the same type as table.
- **em** – A Tensor. Must have the same type as table.
- **last_layer_size** – An int.
- **name** – A name for the operation (optional).

Returns

A Tensor. Has the same type as table.

```
deepmd.env.op_module.tabulate_fusion_se_a_grad(table, table_info, em_x, em, dy, descriptor,
                                              name=None)
```

TODO: add doc.

Parameters

- **table** – A Tensor. Must be one of the following types: float32, float64.
- **table_info** – A Tensor. Must have the same type as table.
- **em_x** – A Tensor. Must have the same type as table.
- **em** – A Tensor. Must have the same type as table.

- **dy** – A Tensor. Must have the same type as table.
- **descriptor** – A Tensor. Must have the same type as table.
- **name** – A name for the operation (optional).

Returns

A tuple of Tensor objects (dy_dem_x, dy_dem).

dy_dem_x: A Tensor. Has the same type as table. dy_dem: A Tensor. Has the same type as table.

```
deepmd.env.op_module.tabulate_fusion_se_a_grad_grad(table, table_info, em_x, em, dz_dy_dem_x,
                                                    dz_dy_dem, descriptor, name=None)
```

TODO: add doc.

Parameters

- **table** – A Tensor. Must be one of the following types: float32, float64.
- **table_info** – A Tensor. Must have the same type as table.
- **em_x** – A Tensor. Must have the same type as table.
- **em** – A Tensor. Must have the same type as table.
- **dz_dy_dem_x** – A Tensor. Must have the same type as table.
- **dz_dy_dem** – A Tensor. Must have the same type as table.
- **descriptor** – A Tensor. Must have the same type as table.
- **name** – A name for the operation (optional).

Returns

A Tensor. Has the same type as table.

```
deepmd.env.op_module.tabulate_fusion_se_r(table, table_info, em, last_layer_size, name=None)
```

TODO: add doc.

Parameters

- **table** – A Tensor. Must be one of the following types: float32, float64.
- **table_info** – A Tensor. Must have the same type as table.
- **em** – A Tensor. Must have the same type as table.
- **last_layer_size** – An int.
- **name** – A name for the operation (optional).

Returns

A Tensor. Has the same type as table.

```
deepmd.env.op_module.tabulate_fusion_se_r_grad(table, table_info, em, dy, descriptor, name=None)
```

TODO: add doc.

Parameters

- **table** – A Tensor. Must be one of the following types: float32, float64.
- **table_info** – A Tensor. Must have the same type as table.
- **em** – A Tensor. Must have the same type as table.
- **dy** – A Tensor. Must have the same type as table.

- **descriptor** – A Tensor. Must have the same type as table.
- **name** – A name for the operation (optional).

Returns

A Tensor. Has the same type as table.

```
deepmd.env.op_module.tabulate_fusion_se_r_grad_grad(table, table_info, em, dz_dy_dem, descriptor,  
                                                    name=None)
```

TODO: add doc.

Parameters

- **table** – A Tensor. Must be one of the following types: float32, float64.
- **table_info** – A Tensor. Must have the same type as table.
- **em** – A Tensor. Must have the same type as table.
- **dz_dy_dem** – A Tensor. Must have the same type as table.
- **descriptor** – A Tensor. Must have the same type as table.
- **name** – A name for the operation (optional).

Returns

A Tensor. Has the same type as table.

```
deepmd.env.op_module.tabulate_fusion_se_t(table, table_info, em_x, em, last_layer_size,  
                                           name=None)
```

TODO: add doc.

Parameters

- **table** – A Tensor. Must be one of the following types: float32, float64.
- **table_info** – A Tensor. Must have the same type as table.
- **em_x** – A Tensor. Must have the same type as table.
- **em** – A Tensor. Must have the same type as table.
- **last_layer_size** – An int.
- **name** – A name for the operation (optional).

Returns

A Tensor. Has the same type as table.

```
deepmd.env.op_module.tabulate_fusion_se_t_grad(table, table_info, em_x, em, dy, descriptor,  
                                                name=None)
```

TODO: add doc.

Parameters

- **table** – A Tensor. Must be one of the following types: float32, float64.
- **table_info** – A Tensor. Must have the same type as table.
- **em_x** – A Tensor. Must have the same type as table.
- **em** – A Tensor. Must have the same type as table.
- **dy** – A Tensor. Must have the same type as table.
- **descriptor** – A Tensor. Must have the same type as table.

- **name** – A name for the operation (optional).

Returns

A tuple of Tensor objects (dy_dem_x, dy_dem).

dy_dem_x: A Tensor. Has the same type as table. dy_dem: A Tensor. Has the same type as table.

```
deepmd.env.op_module.tabulate_fusion_se_t_grad_grad(table, table_info, em_x, em, dz_dy_dem_x,
                                                    dz_dy_dem, descriptor, name=None)
```

TODO: add doc.

Parameters

- **table** – A Tensor. Must be one of the following types: float32, float64.
- **table_info** – A Tensor. Must have the same type as table.
- **em_x** – A Tensor. Must have the same type as table.
- **em** – A Tensor. Must have the same type as table.
- **dz_dy_dem_x** – A Tensor. Must have the same type as table.
- **dz_dy_dem** – A Tensor. Must have the same type as table.
- **descriptor** – A Tensor. Must have the same type as table.
- **name** – A name for the operation (optional).

Returns

A Tensor. Has the same type as table.

```
deepmd.env.op_module.tanh4_flt_nvnmmd(x, name=None)
```

TODO: add doc.

Parameters

- **x** – A Tensor. Must be one of the following types: float32, float64.
- **name** – A name for the operation (optional).

Returns

A Tensor. Has the same type as x.

```
deepmd.env.op_module.unaggregated_dy2_dx(z, w, dy_dx, dy2_dx, ybar, functype, name=None)
```

TODO: add doc.

Parameters

- **z** – A Tensor. Must be one of the following types: float32, float64.
- **w** – A Tensor. Must have the same type as z.
- **dy_dx** – A Tensor. Must have the same type as z.
- **dy2_dx** – A Tensor. Must have the same type as z.
- **ybar** – A Tensor. Must have the same type as z.
- **functype** – A Tensor of type int32.
- **name** – A name for the operation (optional).

Returns

A Tensor. Has the same type as z.

`deepmd.env.op_module.unaggregated_dy2_dx_s(y, dy, w, xbar, functype, name=None)`

TODO: add doc.

Parameters

- **y** – A Tensor. Must be one of the following types: float32, float64.
- **dy** – A Tensor. Must have the same type as y.
- **w** – A Tensor. Must have the same type as y.
- **xbar** – A Tensor. Must have the same type as y.
- **functype** – A Tensor of type int32.
- **name** – A name for the operation (optional).

Returns

A Tensor. Has the same type as y.

`deepmd.env.op_module.unaggregated_dy_dx(z, w, dy_dx, ybar, functype, name=None)`

TODO: add doc.

Parameters

- **z** – A Tensor. Must be one of the following types: float32, float64.
- **w** – A Tensor. Must have the same type as z.
- **dy_dx** – A Tensor. Must have the same type as z.
- **ybar** – A Tensor. Must have the same type as z.
- **functype** – A Tensor of type int32.
- **name** – A name for the operation (optional).

Returns

A Tensor. Has the same type as z.

`deepmd.env.op_module.unaggregated_dy_dx_s(y, w, xbar, functype, name=None)`

TODO: add doc.

Parameters

- **y** – A Tensor. Must be one of the following types: float32, float64.
- **w** – A Tensor. Must have the same type as y.
- **xbar** – A Tensor. Must have the same type as y.
- **functype** – A Tensor of type int32.
- **name** – A name for the operation (optional).

Returns

A Tensor. Has the same type as y.

18.2 op_grads_module

Python wrappers around TensorFlow ops.

This file is MACHINE GENERATED! Do not edit.

```
deepmd.env.op_grads_module.ProdForceGrad(grad, net_deriv, in_deriv, nlist, axis, natoms, n_a_sel,
                                           n_r_sel, name=None)
```

TODO: add doc.

Parameters

- **grad** – A Tensor. Must be one of the following types: float32, float64.
- **net_deriv** – A Tensor. Must have the same type as grad.
- **in_deriv** – A Tensor. Must have the same type as grad.
- **nlist** – A Tensor of type int32.
- **axis** – A Tensor of type int32.
- **natoms** – A Tensor of type int32.
- **n_a_sel** – An int.
- **n_r_sel** – An int.
- **name** – A name for the operation (optional).

Returns

A Tensor. Has the same type as grad.

```
deepmd.env.op_grads_module.ProdForceSeAGrad(grad, net_deriv, in_deriv, nlist, natoms, n_a_sel,
                                              n_r_sel, name=None)
```

TODO: add doc.

Parameters

- **grad** – A Tensor. Must be one of the following types: float32, float64.
- **net_deriv** – A Tensor. Must have the same type as grad.
- **in_deriv** – A Tensor. Must have the same type as grad.
- **nlist** – A Tensor of type int32.
- **natoms** – A Tensor of type int32.
- **n_a_sel** – An int.
- **n_r_sel** – An int.
- **name** – A name for the operation (optional).

Returns

A Tensor. Has the same type as grad.

```
deepmd.env.op_grads_module.ProdForceSeAMaskGrad(grad, net_deriv, in_deriv, mask, nlist,
                                                  total_atom_num, name=None)
```

TODO: add doc.

Parameters

- **grad** – A Tensor. Must be one of the following types: float32, float64.

- **net_deriv** – A Tensor. Must have the same type as grad.
- **in_deriv** – A Tensor. Must have the same type as grad.
- **mask** – A Tensor of type int32.
- **nlist** – A Tensor of type int32.
- **total_atom_num** – An int.
- **name** – A name for the operation (optional).

Returns

A Tensor. Has the same type as grad.

```
deepmd.env.op_grads_module.ProdForceSeRGrad(grad, net_deriv, in_deriv, nlist, natoms, name=None)
```

TODO: add doc.

Parameters

- **grad** – A Tensor. Must be one of the following types: float32, float64.
- **net_deriv** – A Tensor. Must have the same type as grad.
- **in_deriv** – A Tensor. Must have the same type as grad.
- **nlist** – A Tensor of type int32.
- **natoms** – A Tensor of type int32.
- **name** – A name for the operation (optional).

Returns

A Tensor. Has the same type as grad.

```
deepmd.env.op_grads_module.ProdVirialGrad(grad, net_deriv, in_deriv, rij, nlist, axis, natoms, n_a_sel,
                                             n_r_sel, name=None)
```

TODO: add doc.

Parameters

- **grad** – A Tensor. Must be one of the following types: float32, float64.
- **net_deriv** – A Tensor. Must have the same type as grad.
- **in_deriv** – A Tensor. Must have the same type as grad.
- **rij** – A Tensor. Must have the same type as grad.
- **nlist** – A Tensor of type int32.
- **axis** – A Tensor of type int32.
- **natoms** – A Tensor of type int32.
- **n_a_sel** – An int.
- **n_r_sel** – An int.
- **name** – A name for the operation (optional).

Returns

A Tensor. Has the same type as grad.

```
deepmd.env.op_grads_module.ProdVirialSeAGrad(grad, net_deriv, in_deriv, rij, nlist, natoms, n_a_sel,
                                              n_r_sel, name=None)
```

TODO: add doc.

Parameters

- **grad** – A Tensor. Must be one of the following types: float32, float64.
- **net_deriv** – A Tensor. Must have the same type as grad.
- **in_deriv** – A Tensor. Must have the same type as grad.
- **rij** – A Tensor. Must have the same type as grad.
- **nlist** – A Tensor of type int32.
- **natoms** – A Tensor of type int32.
- **n_a_sel** – An int.
- **n_r_sel** – An int.
- **name** – A name for the operation (optional).

Returns

A Tensor. Has the same type as grad.

```
deepmd.env.op_grads_module.ProdVirialSeRGrad(grad, net_deriv, in_deriv, rij, nlist, natoms,
                                              name=None)
```

TODO: add doc.

Parameters

- **grad** – A Tensor. Must be one of the following types: float32, float64.
- **net_deriv** – A Tensor. Must have the same type as grad.
- **in_deriv** – A Tensor. Must have the same type as grad.
- **rij** – A Tensor. Must have the same type as grad.
- **nlist** – A Tensor of type int32.
- **natoms** – A Tensor of type int32.
- **name** – A name for the operation (optional).

Returns

A Tensor. Has the same type as grad.

```
deepmd.env.op_grads_module.SoftMinForceGrad(grad, du, sw_deriv, nlist, natoms, n_a_sel, n_r_sel,
                                              name=None)
```

TODO: add doc.

Parameters

- **grad** – A Tensor. Must be one of the following types: float32, float64.
- **du** – A Tensor. Must have the same type as grad.
- **sw_deriv** – A Tensor. Must have the same type as grad.
- **nlist** – A Tensor of type int32.
- **natoms** – A Tensor of type int32.
- **n_a_sel** – An int.
- **n_r_sel** – An int.
- **name** – A name for the operation (optional).

Returns

A Tensor. Has the same type as grad.

```
deepmd.env.op_grads_module.SoftMinVirialGrad(grad, du, sw_deriv, rij, nlist, natoms, n_a_sel, n_r_sel,
                                              name=None)
```

TODO: add doc.

Parameters

- **grad** – A Tensor. Must be one of the following types: float32, float64.
- **du** – A Tensor. Must have the same type as grad.
- **sw_deriv** – A Tensor. Must have the same type as grad.
- **rij** – A Tensor. Must have the same type as grad.
- **nlist** – A Tensor of type int32.
- **natoms** – A Tensor of type int32.
- **n_a_sel** – An int.
- **n_r_sel** – An int.
- **name** – A name for the operation (optional).

Returns

A Tensor. Has the same type as grad.

```
deepmd.env.op_grads_module.prod_force_grad(grad, net_deriv, in_deriv, nlist, axis, natoms, n_a_sel,
                                             n_r_sel, name=None)
```

TODO: add doc.

Parameters

- **grad** – A Tensor. Must be one of the following types: float32, float64.
- **net_deriv** – A Tensor. Must have the same type as grad.
- **in_deriv** – A Tensor. Must have the same type as grad.
- **nlist** – A Tensor of type int32.
- **axis** – A Tensor of type int32.
- **natoms** – A Tensor of type int32.
- **n_a_sel** – An int.
- **n_r_sel** – An int.
- **name** – A name for the operation (optional).

Returns

A Tensor. Has the same type as grad.

```
deepmd.env.op_grads_module.prod_force_se_a_grad(grad, net_deriv, in_deriv, nlist, natoms, n_a_sel,
                                                  n_r_sel, name=None)
```

TODO: add doc.

Parameters

- **grad** – A Tensor. Must be one of the following types: float32, float64.
- **net_deriv** – A Tensor. Must have the same type as grad.

- **in_deriv** – A Tensor. Must have the same type as grad.
- **nlist** – A Tensor of type int32.
- **natoms** – A Tensor of type int32.
- **n_a_sel** – An int.
- **n_r_sel** – An int.
- **name** – A name for the operation (optional).

Returns

A Tensor. Has the same type as grad.

```
deepmd.env.op_grads_module.prod_force_se_a_mask_grad(grad, net_deriv, in_deriv, mask, nlist,
                                                    total_atom_num, name=None)
```

TODO: add doc.

Parameters

- **grad** – A Tensor. Must be one of the following types: float32, float64.
- **net_deriv** – A Tensor. Must have the same type as grad.
- **in_deriv** – A Tensor. Must have the same type as grad.
- **mask** – A Tensor of type int32.
- **nlist** – A Tensor of type int32.
- **total_atom_num** – An int.
- **name** – A name for the operation (optional).

Returns

A Tensor. Has the same type as grad.

```
deepmd.env.op_grads_module.prod_force_se_r_grad(grad, net_deriv, in_deriv, nlist, natoms,
                                                name=None)
```

TODO: add doc.

Parameters

- **grad** – A Tensor. Must be one of the following types: float32, float64.
- **net_deriv** – A Tensor. Must have the same type as grad.
- **in_deriv** – A Tensor. Must have the same type as grad.
- **nlist** – A Tensor of type int32.
- **natoms** – A Tensor of type int32.
- **name** – A name for the operation (optional).

Returns

A Tensor. Has the same type as grad.

```
deepmd.env.op_grads_module.prod_virial_grad(grad, net_deriv, in_deriv, rij, nlist, axis, natoms,
                                           n_a_sel, n_r_sel, name=None)
```

TODO: add doc.

Parameters

- **grad** – A Tensor. Must be one of the following types: float32, float64.

- **net_deriv** – A Tensor. Must have the same type as grad.
- **in_deriv** – A Tensor. Must have the same type as grad.
- **rij** – A Tensor. Must have the same type as grad.
- **nlist** – A Tensor of type int32.
- **axis** – A Tensor of type int32.
- **natoms** – A Tensor of type int32.
- **n_a_sel** – An int.
- **n_r_sel** – An int.
- **name** – A name for the operation (optional).

Returns

A Tensor. Has the same type as grad.

```
deepmd.env.op_grads_module.prod_virial_se_a_grad(grad, net_deriv, in_deriv, rij, nlist, natoms,  
                                                n_a_sel, n_r_sel, name=None)
```

TODO: add doc.

Parameters

- **grad** – A Tensor. Must be one of the following types: float32, float64.
- **net_deriv** – A Tensor. Must have the same type as grad.
- **in_deriv** – A Tensor. Must have the same type as grad.
- **rij** – A Tensor. Must have the same type as grad.
- **nlist** – A Tensor of type int32.
- **natoms** – A Tensor of type int32.
- **n_a_sel** – An int.
- **n_r_sel** – An int.
- **name** – A name for the operation (optional).

Returns

A Tensor. Has the same type as grad.

```
deepmd.env.op_grads_module.prod_virial_se_r_grad(grad, net_deriv, in_deriv, rij, nlist, natoms,  
                                                name=None)
```

TODO: add doc.

Parameters

- **grad** – A Tensor. Must be one of the following types: float32, float64.
- **net_deriv** – A Tensor. Must have the same type as grad.
- **in_deriv** – A Tensor. Must have the same type as grad.
- **rij** – A Tensor. Must have the same type as grad.
- **nlist** – A Tensor of type int32.
- **natoms** – A Tensor of type int32.
- **name** – A name for the operation (optional).

Returns

A Tensor. Has the same type as grad.

```
deepmd.env.op_grads_module.soft_min_force_grad(grad, du, sw_deriv, nlist, natoms, n_a_sel, n_r_sel,
                                                name=None)
```

TODO: add doc.

Parameters

- **grad** – A Tensor. Must be one of the following types: float32, float64.
- **du** – A Tensor. Must have the same type as grad.
- **sw_deriv** – A Tensor. Must have the same type as grad.
- **nlist** – A Tensor of type int32.
- **natoms** – A Tensor of type int32.
- **n_a_sel** – An int.
- **n_r_sel** – An int.
- **name** – A name for the operation (optional).

Returns

A Tensor. Has the same type as grad.

```
deepmd.env.op_grads_module.soft_min_virial_grad(grad, du, sw_deriv, rij, nlist, natoms, n_a_sel,
                                                n_r_sel, name=None)
```

TODO: add doc.

Parameters

- **grad** – A Tensor. Must be one of the following types: float32, float64.
- **du** – A Tensor. Must have the same type as grad.
- **sw_deriv** – A Tensor. Must have the same type as grad.
- **rij** – A Tensor. Must have the same type as grad.
- **nlist** – A Tensor of type int32.
- **natoms** – A Tensor of type int32.
- **n_a_sel** – An int.
- **n_r_sel** – An int.
- **name** – A name for the operation (optional).

Returns

A Tensor. Has the same type as grad.

19.3.2 Classes and Structs

Struct `deepmd_exception`

- Defined in `file_source_api_cc_include_common.h`

Inheritance Relationships

Derived Type

- `public deepmd::tf_exception (Struct tf_exception)`

Struct Documentation

struct **deepmd_exception**

Subclassed by [deepmd::tf_exception](#)

Struct NeighborListData

- Defined in file `_source_api_cc_include_common.h`

Struct Documentation

struct **NeighborListData**

Public Functions

void **copy_from_nlist**(const InputNlist &inlist)

void **shuffle**(const std::vector<int> &fwd_map)

void **shuffle**(const deepmd::AtomMap &map)

void **shuffle_exclude_empty**(const std::vector<int> &fwd_map)

void **make_inlist**(InputNlist &inlist)

Public Members

std::vector<int> **ilist**

Array stores the core region atom's index.

std::vector<std::vector<int>> **jlist**

Array stores the core region atom's neighbor index.

std::vector<int> **numneigh**

Array stores the number of neighbors of core region atoms.

std::vector<int*> **firstneigh**

Array stores the the location of the first neighbor of core region atoms.

Struct `tf_exception`

- Defined in file `_source_api_cc_include_common.h`

Inheritance Relationships

Base Type

- `public deepmd_exception (Struct deepmd_exception)`

Struct Documentation

```
struct tf_exception : public deepmd_exception
    Throw exception if TensorFlow doesn't work.
```

Public Functions

```
inline tf_exception()
inline tf_exception(const std::string &msg)
```

Class `AtomMap`

- Defined in file `_source_api_cc_include_AtomMap.h`

Class Documentation

```
class AtomMap
```

Public Functions

```
AtomMap()

AtomMap(const std::vector<int>::const_iterator in_begin, const std::vector<int>::const_iterator
        in_end)

template<typename VALUETYPE>
void forward(typename std::vector<VALUETYPE>::iterator out, const typename
        std::vector<VALUETYPE>::const_iterator in, const int stride = 1, const int nframes =
        1, const int nall = 0) const

template<typename VALUETYPE>
void backward(typename std::vector<VALUETYPE>::iterator out, const typename
        std::vector<VALUETYPE>::const_iterator in, const int stride = 1, const int nframes
        = 1, const int nall = 0) const
```

```
inline const std::vector<int> &get_type() const  
inline const std::vector<int> &get_fwd_map() const  
inline const std::vector<int> &get_bkw_map() const
```

Class DeepPot

- Defined in file_source_api_cc_include_DeepPot.h

Class Documentation

class **DeepPot**

Deep Potential.

Public Functions

DeepPot()

DP constructor without initialization.

~DeepPot()

DeepPot(const std::string &model, const int &gpu_rank = 0, const std::string &file_content = "")

DP constructor with initialization.

Parameters

- **model** – [in] The name of the frozen model file.
- **gpu_rank** – [in] The GPU rank. Default is 0.
- **file_content** – [in] The content of the model file. If it is not empty, DP will read from the string instead of the file.

void **init**(const std::string &model, const int &gpu_rank = 0, const std::string &file_content = "")

Initialize the DP.

Parameters

- **model** – [in] The name of the frozen model file.
- **gpu_rank** – [in] The GPU rank. Default is 0.
- **file_content** – [in] The content of the model file. If it is not empty, DP will read from the string instead of the file.

void **print_summary**(const std::string &pre) const

Print the DP summary to the screen.

Parameters

- **pre** – [in] The prefix to each line.

template<typename **VALUETYPE**, typename **ENERGYVTYPE**>

```
void compute(ENERGYVTYPE &ener, std::vector<VALUETYPE> &force,
             std::vector<VALUETYPE> &virial, const std::vector<VALUETYPE> &coord, const
             std::vector<int> &atype, const std::vector<VALUETYPE> &box, const
             std::vector<VALUETYPE> &fparam = std::vector<VALUETYPE>(), const
             std::vector<VALUETYPE> &aparam = std::vector<VALUETYPE>())
```

Evaluate the energy, force and virial by using this DP.

Parameters

- **ener** – [out] The system energy.
- **force** – [out] The force on each atom.
- **virial** – [out] The virial.
- **coord** – [in] The coordinates of atoms. The array should be of size nframes x natoms x 3.
- **atype** – [in] The atom types. The list should contain natoms ints.
- **box** – [in] The cell of the region. The array should be of size nframes x 9.
- **fparam** – [in] The frame parameter. The array can be of size : nframes x dim_fparam. dim_fparam. Then all frames are assumed to be provided with the same fparam.
- **aparam** – [in] The atomic parameter The array can be of size : nframes x natoms x dim_aparam. natoms x dim_aparam. Then all frames are assumed to be provided with the same aparam.

```
template<typename VALUETYPE, typename ENERGYVTYPE>
void compute(ENERGYVTYPE &ener, std::vector<VALUETYPE> &force,
             std::vector<VALUETYPE> &virial, const std::vector<VALUETYPE> &coord, const
             std::vector<int> &atype, const std::vector<VALUETYPE> &box, const int nghost,
             const InputNlist &inlist, const int &ago, const std::vector<VALUETYPE> &fparam =
             std::vector<VALUETYPE>(), const std::vector<VALUETYPE> &aparam =
             std::vector<VALUETYPE>())
```

Evaluate the energy, force and virial by using this DP.

Parameters

- **ener** – [out] The system energy.
- **force** – [out] The force on each atom.
- **virial** – [out] The virial.
- **coord** – [in] The coordinates of atoms. The array should be of size nframes x natoms x 3.
- **atype** – [in] The atom types. The list should contain natoms ints.
- **box** – [in] The cell of the region. The array should be of size nframes x 9.
- **nghost** – [in] The number of ghost atoms.
- **inlist** – [in] The input neighbour list.
- **ago** – [in] Update the internal neighbour list if ago is 0.
- **fparam** – [in] The frame parameter. The array can be of size : nframes x dim_fparam. dim_fparam. Then all frames are assumed to be provided with the same fparam.

- **aparam** – [in] The atomic parameter The array can be of size : nframes x natoms x dim_aparam. natoms x dim_aparam. Then all frames are assumed to be provided with the same aparam.

```
template<typename VALUETYPE, typename ENERGYVTYPE>
void compute(ENERGYVTYPE &ener, std::vector<VALUETYPE> &force,
             std::vector<VALUETYPE> &virial, std::vector<VALUETYPE> &atom_energy,
             std::vector<VALUETYPE> &atom_virial, const std::vector<VALUETYPE> &coord,
             const std::vector<int> &atype, const std::vector<VALUETYPE> &box, const
             std::vector<VALUETYPE> &fparam = std::vector<VALUETYPE>(), const
             std::vector<VALUETYPE> &aparam = std::vector<VALUETYPE>())
```

Evaluate the energy, force, virial, atomic energy, and atomic virial by using this DP.

Parameters

- **ener** – [out] The system energy.
- **force** – [out] The force on each atom.
- **virial** – [out] The virial.
- **atom_energy** – [out] The atomic energy.
- **atom_virial** – [out] The atomic virial.
- **coord** – [in] The coordinates of atoms. The array should be of size nframes x natoms x 3.
- **atype** – [in] The atom types. The list should contain natoms ints.
- **box** – [in] The cell of the region. The array should be of size nframes x 9.
- **fparam** – [in] The frame parameter. The array can be of size : nframes x dim_fparam. dim_fparam. Then all frames are assumed to be provided with the same fparam.
- **aparam** – [in] The atomic parameter The array can be of size : nframes x natoms x dim_aparam. natoms x dim_aparam. Then all frames are assumed to be provided with the same aparam.

```
template<typename VALUETYPE, typename ENERGYVTYPE>
void compute(ENERGYVTYPE &ener, std::vector<VALUETYPE> &force,
             std::vector<VALUETYPE> &virial, std::vector<VALUETYPE> &atom_energy,
             std::vector<VALUETYPE> &atom_virial, const std::vector<VALUETYPE> &coord,
             const std::vector<int> &atype, const std::vector<VALUETYPE> &box, const int
             nghost, const InputNlist &imp_list, const int &ago, const std::vector<VALUETYPE>
             &fparam = std::vector<VALUETYPE>(), const std::vector<VALUETYPE>
             &aparam = std::vector<VALUETYPE>())
```

Evaluate the energy, force, virial, atomic energy, and atomic virial by using this DP.

Parameters

- **ener** – [out] The system energy.
- **force** – [out] The force on each atom.
- **virial** – [out] The virial.
- **atom_energy** – [out] The atomic energy.
- **atom_virial** – [out] The atomic virial.

- **coord** – [in] The coordinates of atoms. The array should be of size nframes x natoms x 3.
- **atype** – [in] The atom types. The list should contain natoms ints.
- **box** – [in] The cell of the region. The array should be of size nframes x 9.
- **nghost** – [in] The number of ghost atoms.
- **lmp_list** – [in] The input neighbour list.
- **ago** – [in] Update the internal neighbour list if ago is 0.
- **fparam** – [in] The frame parameter. The array can be of size : nframes x dim_fparam. dim_fparam. Then all frames are assumed to be provided with the same fparam.
- **aparam** – [in] The atomic parameter The array can be of size : nframes x natoms x dim_aparam. natoms x dim_aparam. Then all frames are assumed to be provided with the same aparam.

```
template<typename VALUETYPE, typename ENERGYVTYPE>
void compute_mixed_type(ENERGYVTYPE &ener, std::vector<VALUETYPE> &force,
                        std::vector<VALUETYPE> &virial, const int &nframes, const
                        std::vector<VALUETYPE> &coord, const std::vector<int> &atype,
                        const std::vector<VALUETYPE> &box, const
                        std::vector<VALUETYPE> &fparam = std::vector<VALUETYPE>(),
                        const std::vector<VALUETYPE> &aparam =
                        std::vector<VALUETYPE>())
```

Evaluate the energy, force, and virial with the mixed type by using this DP.

Parameters

- **ener** – [out] The system energy.
- **force** – [out] The force on each atom.
- **virial** – [out] The virial.
- **nframes** – [in] The number of frames.
- **coord** – [in] The coordinates of atoms. The array should be of size nframes x natoms x 3.
- **atype** – [in] The atom types. The array should be of size nframes x natoms.
- **box** – [in] The cell of the region. The array should be of size nframes x 9.
- **fparam** – [in] The frame parameter. The array can be of size : nframes x dim_fparam. dim_fparam. Then all frames are assumed to be provided with the same fparam.
- **aparam** – [in] The atomic parameter The array can be of size : nframes x natoms x dim_aparam. natoms x dim_aparam. Then all frames are assumed to be provided with the same aparam.

```
template<typename VALUETYPE, typename ENERGYVTYPE>
```

```
void compute_mixed_type(ENERGYVTYPE &ener, std::vector<VALUETYPE> &force,
    std::vector<VALUETYPE> &virial, std::vector<VALUETYPE>
    &atom_energy, std::vector<VALUETYPE> &atom_virial, const int
    &nframes, const std::vector<VALUETYPE> &coord, const
    std::vector<int> &atype, const std::vector<VALUETYPE> &box, const
    std::vector<VALUETYPE> &fparam = std::vector<VALUETYPE>(),
    const std::vector<VALUETYPE> &aparam =
    std::vector<VALUETYPE>())
```

Evaluate the energy, force, and virial with the mixed type by using this DP.

Parameters

- **ener** – [out] The system energy.
- **force** – [out] The force on each atom.
- **virial** – [out] The virial.
- **atom_energy** – [out] The atomic energy.
- **atom_virial** – [out] The atomic virial.
- **nframes** – [in] The number of frames.
- **coord** – [in] The coordinates of atoms. The array should be of size nframes x natoms x 3.
- **atype** – [in] The atom types. The array should be of size nframes x natoms.
- **box** – [in] The cell of the region. The array should be of size nframes x 9.
- **fparam** – [in] The frame parameter. The array can be of size : nframes x dim_fparam. dim_fparam. Then all frames are assumed to be provided with the same fparam.
- **aparam** – [in] The atomic parameter The array can be of size : nframes x natoms x dim_aparam. natoms x dim_aparam. Then all frames are assumed to be provided with the same aparam.

```
inline double cutoff() const
```

Get the cutoff radius.

Returns

The cutoff radius.

```
inline int numb_types() const
```

Get the number of types.

Returns

The number of types.

```
inline int dim_fparam() const
```

Get the dimension of the frame parameter.

Returns

The dimension of the frame parameter.

```
inline int dim_aparam() const
```

Get the dimension of the atomic parameter.

Returns

The dimension of the atomic parameter.

```
void get_type_map(std::string &type_map)
    Get the type map (element name of the atom types) of this model.
    Parameters
        type_map – [out] The type map of this model.
```

Class DeepPotModelDevi

- Defined in file_source_api_cc_include_DeepPot.h

Class Documentation

```
class DeepPotModelDevi
```

Public Functions

```
DeepPotModelDevi()
```

DP model deviation constructor without initialization.

```
~DeepPotModelDevi()
```

```
DeepPotModelDevi(const std::vector<std::string> &models, const int &gpu_rank = 0, const
                  std::vector<std::string> &file_contents = std::vector<std::string>())
```

DP model deviation constructor with initialization.

Parameters

- **models** – [in] The names of the frozen model files.
- **gpu_rank** – [in] The GPU rank. Default is 0.
- **file_contents** – [in] The contents of the model files. If it is not empty, DP will read from the strings instead of the files.

```
void init(const std::vector<std::string> &models, const int &gpu_rank = 0, const
          std::vector<std::string> &file_contents = std::vector<std::string>())
```

Initialize the DP model deviation contructor.

Parameters

- **models** – [in] The names of the frozen model files.
- **gpu_rank** – [in] The GPU rank. Default is 0.
- **file_contents** – [in] The contents of the model files. If it is not empty, DP will read from the strings instead of the files.

```
template<typename VALUETYPE>
```

```
void compute(std::vector<ENERGYTYPE> &all_ener, std::vector<std::vector<VALUETYPE>>
             &all_force, std::vector<std::vector<VALUETYPE>> &all_virial, const
             std::vector<VALUETYPE> &coord, const std::vector<int> &atype, const
             std::vector<VALUETYPE> &box, const int nghost, const InputNlist &imp_list, const
             int &ago, const std::vector<VALUETYPE> &fparam = std::vector<VALUETYPE>(),
             const std::vector<VALUETYPE> &aparam = std::vector<VALUETYPE>())
```

Evaluate the energy, force and virial by using these DP models.

Parameters

- **all_ener** – [out] The system energies of all models.
- **all_force** – [out] The forces on each atom of all models.
- **all_virial** – [out] The virials of all models.
- **coord** – [in] The coordinates of atoms. The array should be of size nframes x natoms x 3.
- **atype** – [in] The atom types. The list should contain natoms ints.
- **box** – [in] The cell of the region. The array should be of size nframes x 9.
- **nghost** – [in] The number of ghost atoms.
- **lmp_list** – [in] The input neighbour list.
- **ago** – [in] Update the internal neighbour list if ago is 0.
- **fparam** – [in] The frame parameter. The array can be of size : nframes x dim_fparam. dim_fparam. Then all frames are assumed to be provided with the same fparam.
- **aparam** – [in] The atomic parameter The array can be of size : nframes x natoms x dim_aparam. natoms x dim_aparam. Then all frames are assumed to be provided with the same aparam. dim_aparam. Then all frames and atoms are provided with the same aparam.

```
template<typename VALUETYPE>
void compute(std::vector<ENERGYTYPE> &all_ener, std::vector<std::vector<VALUETYPE>>>
    &all_force, std::vector<std::vector<VALUETYPE>>> &all_virial,
    std::vector<std::vector<VALUETYPE>>> &all_atom_energy,
    std::vector<std::vector<VALUETYPE>>> &all_atom_virial, const
    std::vector<VALUETYPE> &coord, const std::vector<int> &atype, const
    std::vector<VALUETYPE> &box, const int nghost, const InputNlist &lmp_list, const
    int &ago, const std::vector<VALUETYPE> &fparam = std::vector<VALUETYPE>(),
    const std::vector<VALUETYPE> &aparam = std::vector<VALUETYPE>())
```

Evaluate the energy, force, virial, atomic energy, and atomic virial by using these DP models.

Parameters

- **all_ener** – [out] The system energies of all models.
- **all_force** – [out] The forces on each atom of all models.
- **all_virial** – [out] The virials of all models.
- **all_atom_energy** – [out] The atomic energies of all models.
- **all_atom_virial** – [out] The atomic virials of all models.
- **coord** – [in] The coordinates of atoms. The array should be of size nframes x natoms x 3.
- **atype** – [in] The atom types. The list should contain natoms ints.
- **box** – [in] The cell of the region. The array should be of size nframes x 9.
- **nghost** – [in] The number of ghost atoms.
- **lmp_list** – [in] The input neighbour list.
- **ago** – [in] Update the internal neighbour list if ago is 0.

- **fparam** – [in] The frame parameter. The array can be of size : nframes x dim_fparam. dim_fparam. Then all frames are assumed to be provided with the same fparam.
- **aparam** – [in] The atomic parameter The array can be of size : nframes x natoms x dim_aparam. natoms x dim_aparam. Then all frames are assumed to be provided with the same aparam. dim_aparam. Then all frames and atoms are provided with the same aparam.

inline double **cutoff**() const

Get the cutoff radius.

Returns

The cutoff radius.

inline int **numb_types**() const

Get the number of types.

Returns

The number of types.

inline int **dim_fparam**() const

Get the dimension of the frame parameter.

Returns

The dimension of the frame parameter.

inline int **dim_aparam**() const

Get the dimension of the atomic parameter.

Returns

The dimension of the atomic parameter.

template<typename **VALUETYPE**>

void **compute_avg**(**VALUETYPE** &dener, const std::vector<**VALUETYPE**> &all_energy)

Compute the average energy.

Parameters

- **dener** – [out] The average energy.
- **all_energy** – [in] The energies of all models.

template<typename **VALUETYPE**>

void **compute_avg**(std::vector<**VALUETYPE**> &avg, const
std::vector<std::vector<**VALUETYPE**>> &xx)

Compute the average of vectors.

Parameters

- **avg** – [out] The average of vectors.
- **xx** – [in] The vectors of all models.

template<typename **VALUETYPE**>

void **compute_std**(std::vector<**VALUETYPE**> &std, const std::vector<**VALUETYPE**> &avg, const
std::vector<std::vector<**VALUETYPE**>> &xx, const int &stride)

Compute the standard deviation of vectors.

Parameters

- **std** – [out] The standard deviation of vectors.

- **avg** – [in] The average of vectors.
- **xx** – [in] The vectors of all models.
- **stride** – [in] The stride to compute the deviation.

```
template<typename VALUETYPE>
void compute_relative_std(std::vector<VALUETYPE> &std, const std::vector<VALUETYPE>
                        &avg, const VALUETYPE eps, const int &stride)
```

Compute the relative standard deviation of vectors.

Parameters

- **std** – [out] The standard deviation of vectors.
- **avg** – [in] The average of vectors.
- **eps** – [in] The level parameter for computing the deviation.
- **stride** – [in] The stride to compute the deviation.

```
template<typename VALUETYPE>
void compute_std_e(std::vector<VALUETYPE> &std, const std::vector<VALUETYPE> &avg,
                  const std::vector<std::vector<VALUETYPE>> &xx)
```

Compute the standard deviation of atomic energies.

Parameters

- **std** – [out] The standard deviation of atomic energies.
- **avg** – [in] The average of atomic energies.
- **xx** – [in] The vectors of all atomic energies.

```
template<typename VALUETYPE>
void compute_std_f(std::vector<VALUETYPE> &std, const std::vector<VALUETYPE> &avg,
                  const std::vector<std::vector<VALUETYPE>> &xx)
```

Compute the standard deviation of forces.

Parameters

- **std** – [out] The standard deviation of forces.
- **avg** – [in] The average of forces.
- **xx** – [in] The vectors of all forces.

```
template<typename VALUETYPE>
void compute_relative_std_f(std::vector<VALUETYPE> &std, const std::vector<VALUETYPE>
                          &avg, const VALUETYPE eps)
```

Compute the relative standard deviation of forces.

Parameters

- **std** – [out] The relative standard deviation of forces.
- **avg** – [in] The relative average of forces.
- **eps** – [in] The level parameter for computing the deviation.

Class DeepTensor

- Defined in file `_source_api_cc_include_DeepTensor.h`

Class Documentation

class **DeepTensor**

Deep Tensor.

Public Functions

DeepTensor()

Deep Tensor constructor without initialization.

~DeepTensor()

DeepTensor(const std::string &model, const int &gpu_rank = 0, const std::string &name_scope = "")

Deep Tensor constructor with initialization..

Parameters

- **model** – [in] The name of the frozen model file.
- **gpu_rank** – [in] The GPU rank. Default is 0.
- **name_scope** – [in] Name scopes of operations.

void **init**(const std::string &model, const int &gpu_rank = 0, const std::string &name_scope = "")

Initialize the Deep Tensor.

Parameters

- **model** – [in] The name of the frozen model file.
- **gpu_rank** – [in] The GPU rank. Default is 0.
- **name_scope** – [in] Name scopes of operations.

void **print_summary**(const std::string &pre) const

Print the DP summary to the screen.

Parameters

- **pre** – [in] The prefix to each line.

template<typename **VALUETYPE**>

void **compute**(std::vector<**VALUETYPE**> &value, const std::vector<**VALUETYPE**> &coord, const std::vector<int> &atype, const std::vector<**VALUETYPE**> &box)

Evaluate the value by using this model.

Parameters

- **value** – [out] The value to evalute, usually would be the atomic tensor.
- **coord** – [in] The coordinates of atoms. The array should be of size natoms x 3.
- **atype** – [in] The atom types. The list should contain natoms ints.
- **box** – [in] The cell of the region. The array should be of size 9.

template<typename **VALUETYPE**>

```
void compute(std::vector<VALUETYPE> &value, const std::vector<VALUETYPE> &coord, const
            std::vector<int> &atype, const std::vector<VALUETYPE> &box, const int nghost,
            const InputNlist &inlist)
```

Evaluate the value by using this model.

Parameters

- **value** – [out] The value to evaluate, usually would be the atomic tensor.
- **coord** – [in] The coordinates of atoms. The array should be of size natoms x 3.
- **atype** – [in] The atom types. The list should contain natoms ints.
- **box** – [in] The cell of the region. The array should be of size 9.
- **nghost** – [in] The number of ghost atoms.
- **inlist** – [in] The input neighbour list.

```
template<typename VALUETYPE>
void compute(std::vector<VALUETYPE> &global_tensor, std::vector<VALUETYPE> &force,
            std::vector<VALUETYPE> &virial, const std::vector<VALUETYPE> &coord, const
            std::vector<int> &atype, const std::vector<VALUETYPE> &box)
```

Evaluate the global tensor and component-wise force and virial.

Parameters

- **global_tensor** – [out] The global tensor to evaluate.
- **force** – [out] The component-wise force of the global tensor, size odim x natoms x 3.
- **virial** – [out] The component-wise virial of the global tensor, size odim x 9.
- **coord** – [in] The coordinates of atoms. The array should be of size natoms x 3.
- **atype** – [in] The atom types. The list should contain natoms ints.
- **box** – [in] The cell of the region. The array should be of size 9.

```
template<typename VALUETYPE>
void compute(std::vector<VALUETYPE> &global_tensor, std::vector<VALUETYPE> &force,
            std::vector<VALUETYPE> &virial, const std::vector<VALUETYPE> &coord, const
            std::vector<int> &atype, const std::vector<VALUETYPE> &box, const int nghost,
            const InputNlist &inlist)
```

Evaluate the global tensor and component-wise force and virial.

Parameters

- **global_tensor** – [out] The global tensor to evaluate.
- **force** – [out] The component-wise force of the global tensor, size odim x natoms x 3.
- **virial** – [out] The component-wise virial of the global tensor, size odim x 9.
- **coord** – [in] The coordinates of atoms. The array should be of size natoms x 3.
- **atype** – [in] The atom types. The list should contain natoms ints.
- **box** – [in] The cell of the region. The array should be of size 9.
- **nghost** – [in] The number of ghost atoms.
- **inlist** – [in] The input neighbour list.

```
template<typename VALUETYPE>
void compute(std::vector<VALUETYPE> &global_tensor, std::vector<VALUETYPE> &force,
            std::vector<VALUETYPE> &virial, std::vector<VALUETYPE> &atom_tensor,
            std::vector<VALUETYPE> &atom_virial, const std::vector<VALUETYPE> &coord,
            const std::vector<int> &atype, const std::vector<VALUETYPE> &box)
```

Evaluate the global tensor and component-wise force and virial.

Parameters

- **global_tensor** – [out] The global tensor to evaluate.
- **force** – [out] The component-wise force of the global tensor, size odim x natoms x 3.
- **virial** – [out] The component-wise virial of the global tensor, size odim x 9.
- **atom_tensor** – [out] The atomic tensor value of the model, size natoms x odim.
- **atom_virial** – [out] The component-wise atomic virial of the global tensor, size odim x natoms x 9.
- **coord** – [in] The coordinates of atoms. The array should be of size natoms x 3.
- **atype** – [in] The atom types. The list should contain natoms ints.
- **box** – [in] The cell of the region. The array should be of size 9.

```
template<typename VALUETYPE>
void compute(std::vector<VALUETYPE> &global_tensor, std::vector<VALUETYPE> &force,
            std::vector<VALUETYPE> &virial, std::vector<VALUETYPE> &atom_tensor,
            std::vector<VALUETYPE> &atom_virial, const std::vector<VALUETYPE> &coord,
            const std::vector<int> &atype, const std::vector<VALUETYPE> &box, const int
            nghost, const InputNlist &inlist)
```

Evaluate the global tensor and component-wise force and virial.

Parameters

- **global_tensor** – [out] The global tensor to evaluate.
- **force** – [out] The component-wise force of the global tensor, size odim x natoms x 3.
- **virial** – [out] The component-wise virial of the global tensor, size odim x 9.
- **atom_tensor** – [out] The atomic tensor value of the model, size natoms x odim.
- **atom_virial** – [out] The component-wise atomic virial of the global tensor, size odim x natoms x 9.
- **coord** – [in] The coordinates of atoms. The array should be of size natoms x 3.
- **atype** – [in] The atom types. The list should contain natoms ints.
- **box** – [in] The cell of the region. The array should be of size 9.
- **nghost** – [in] The number of ghost atoms.
- **inlist** – [in] The input neighbour list.

```
inline double cutoff() const
```

Get the cutoff radius.

Returns

The cutoff radius.

```
inline int numb_types() const
    Get the number of types.

    Returns
        The number of types.

inline int output_dim() const
    Get the output dimension.

    Returns
        The output dimension.

inline const std::vector<int> &sel_types() const
    Get the list of sel types.

    Returns
        The list of sel types.
```

Class **DipoleChargeModifier**

- Defined in file `_source_api_cc_include_DataModifier.h`

Class Documentation

```
class DipoleChargeModifier
    Dipole charge modifier.
```

Public Functions

```
DipoleChargeModifier()
    Dipole charge modifier without initialization.

DipoleChargeModifier(const std::string &model, const int &gpu_rank = 0, const std::string
    &name_scope = "")
    Dipole charge modifier without initialization.

    Parameters
        • model – [in] The name of the frozen model file.
        • gpu_rank – [in] The GPU rank. Default is 0.
        • name_scope – [in] The name scope.

~DipoleChargeModifier()

void init(const std::string &model, const int &gpu_rank = 0, const std::string &name_scope = "")
    Initialize the dipole charge modifier.

    Parameters
        • model – [in] The name of the frozen model file.
        • gpu_rank – [in] The GPU rank. Default is 0.
        • name_scope – [in] The name scope.
```

void **print_summary**(const std::string &pre) const

Print the DP summary to the screen.

Parameters

pre – [in] The prefix to each line.

template<typename **VALUETYPE**>

void **compute**(std::vector<**VALUETYPE**> &dfcorr_, std::vector<**VALUETYPE**> &dvcorr_, const
std::vector<**VALUETYPE**> &dcoord_, const std::vector<int> &dtype_, const
std::vector<**VALUETYPE**> &dbox, const std::vector<std::pair<int, int>> &pairs,
const std::vector<**VALUETYPE**> &delef_, const int nghost, const InputNlist
&lmp_list)

Evaluate the force and virial correction by using this dipole charge modifier.

Parameters

- **dfcorr_** – [out] The force correction on each atom.
- **dvcorr_** – [out] The virial correction.
- **dcoord_** – [in] The coordinates of atoms. The array should be of size natoms x 3.
- **dtype_** – [in] The atom types. The list should contain natoms ints.
- **dbox** – [in] The cell of the region. The array should be of size 9.
- **pairs** – [in] The pairs of atoms. The list should contain npairs pairs of ints.
- **delef_** – [in] The electric field on each atom. The array should be of size natoms x 3.
- **nghost** – [in] The number of ghost atoms.
- **lmp_list** – [in] The neighbor list.

inline double **cutoff**() const

Get cutoff radius.

Returns

double cutoff radius.

inline int **numb_types**() const

Get the number of atom types.

Returns

int number of atom types.

inline std::vector<int> **sel_types**() const

Get the list of sel types.

Returns

The list of sel types.

19.3.3 Functions

Function `deepmd::check_status`

- Defined in `file_source_api_cc_include_common.h`

Function Documentation

`void deepmd::check_status(const tensorflow::Status &status)`

Check TensorFlow status. Exit if not OK.

Parameters

status – [in] TensorFlow status.

Function `deepmd::convert_pbtxt_to_pb`

- Defined in `file_source_api_cc_include_common.h`

Function Documentation

`void deepmd::convert_pbtxt_to_pb(std::string fn_pb_txt, std::string fn_pb)`

Convert pbtxt to pb.

Parameters

- **fn_pb_txt** – [in] Filename of the pb txt file.
- **fn_pb** – [in] Filename of the pb file.

Function `deepmd::get_env_nthreads`

- Defined in `file_source_api_cc_include_common.h`

Function Documentation

`void deepmd::get_env_nthreads(int &num_intra_nthreads, int &num_inter_nthreads)`

Get the number of threads from the environment variable.

A warning will be thrown if environmental variables are not set.

Parameters

- **num_intra_nthreads** – [out] The number of intra threads. Read from `TF_INTRA_OP_PARALLELISM_THREADS`.
- **num_inter_nthreads** – [out] The number of inter threads. Read from `TF_INTER_OP_PARALLELISM_THREADS`.

Function `deepmd::load_op_library`

- Defined in `file_source_api_cc_include_common.h`

Function Documentation

`void deepmd::load_op_library()`

Dynamically load OP library. This should be called before loading graphs.

Function `deepmd::model_compatible`

- Defined in `file_source_api_cc_include_common.h`

Function Documentation

`bool deepmd::model_compatible(std::string &model_version)`

Check if the model version is supported.

Parameters

model_version – [in] The model version.

Returns

Whether the model is supported (true or false).

Function `deepmd::name_prefix`

- Defined in `file_source_api_cc_include_common.h`

Function Documentation

`std::string deepmd::name_prefix(const std::string &name_scope)`

Function `deepmd::print_summary`

- Defined in `file_source_api_cc_include_common.h`

Function Documentation

`void deepmd::print_summary(const std::string &pre)`

Print the summary of DeePMD-kit, including the version and the build information.

Parameters

pre – [in] The prefix to each line.

Function `deepmd::read_file_to_string`

- Defined in `file_source_api_cc_include_common.h`

Function Documentation

`void deepmd::read_file_to_string(std::string model, std::string &file_content)`

Read model file to a string.

Parameters

- **model** – [in] Path to the model.
- **file_content** – [out] Content of the model file.

Template Function `deepmd::select_by_type`

- Defined in `file_source_api_cc_include_common.h`

Function Documentation

`template<typename VALUETYPE>`

`void deepmd::select_by_type(std::vector<int> &fwd_map, std::vector<int> &bkw_map, int
 &nghost_real, const std::vector<VALUETYPE> &dcoord_, const
 std::vector<int> &dtype_, const int &nghost, const std::vector<int>
 &sel_type_)`

**Template Function `deepmd::select_map(std::vector<VT>&, const std::vector<VT>&, const
std::vector<int>&, const int&, const int&, const int&, const int&)`**

- Defined in `file_source_api_cc_include_common.h`

Function Documentation

`template<typename VT>`

`void deepmd::select_map(std::vector<VT> &out, const std::vector<VT> &in, const std::vector<int>
 &fwd_map, const int &stride, const int &nframes = 1, const int &nall1 = 0,
 const int &nall2 = 0)`

**Template Function `deepmd::select_map(typename std::vector<VT>::iterator, const typename
std::vector<VT>::const_iterator, const std::vector<int>&, const int&, const int&, const int&, const
int&)`**

- Defined in `file_source_api_cc_include_common.h`

Function Documentation

```
template<typename VT>
void deepmd::select_map(typename std::vector<VT>::iterator out, const typename
                        std::vector<VT>::const_iterator in, const std::vector<int> &fwd_map, const

Template Function `deepmd::select_map_inv(std::vector<VT>&, const std::vector<VT>&, const std::vector<int>&, const int&)`

- Defined in `file_source_api_cc_include_common.h`

Function Documentation

```
template<typename VT>
void deepmd::select_map_inv(std::vector<VT> &out, const std::vector<VT> &in, const
                        std::vector<int> &fwd_map, const int &stride)
```

Template Function `deepmd::select_map_inv(typename std::vector<VT>::iterator, const typename std::vector<VT>::const_iterator, const std::vector<int>&, const int&)`

- Defined in `file_source_api_cc_include_common.h`

Function Documentation

```
template<typename VT>
void deepmd::select_map_inv(typename std::vector<VT>::iterator out, const typename
                        std::vector<VT>::const_iterator in, const std::vector<int> &fwd_map,
                        const int &stride)
```

Template Function `deepmd::select_real_atoms`

- Defined in `file_source_api_cc_include_common.h`

Function Documentation

```
template<typename VALUETYPE>
void deepmd::select_real_atoms(std::vector<int> &fwd_map, std::vector<int> &bkw_map, int
                        &nghost_real, const std::vector<VALUETYPE> &dcoord_, const
                        std::vector<int> &dtype_, const int &nghost, const int &ntypes)
```

Function `deepmd::session_get_dtype`

- Defined in `file_source_api_cc_include_common.h`

Function Documentation

```
int deepmd::session_get_dtype(tensorflow::Session *session, const std::string name, const std::string
                               scope = "")
```

Get the type of a tensor.

Parameters

- **session** – [in] TensorFlow session.
- **name** – [in] The name of the tensor.
- **scope** – [in] The scope of the tensor.

Returns

The type of the tensor as int.

Template Function `deepmd::session_get_scalar`

- Defined in `file_source_api_cc_include_common.h`

Function Documentation

```
template<typename VT>
VT deepmd::session_get_scalar(tensorflow::Session *session, const std::string name, const std::string
                               scope = "")
```

Get the value of a tensor.

Parameters

- **session** – [in] TensorFlow session.
- **name** – [in] The name of the tensor.
- **scope** – [in] The scope of the tensor.

Returns

The value of the tensor.

Template Function `deepmd::session_get_vector`

- Defined in `file_source_api_cc_include_common.h`

Function Documentation

```
template<typename VT>
void deepmd::session_get_vector(std::vector<VT> &o_vec, tensorflow::Session *session, const
                                std::string name_, const std::string scope = "")
```

Get the vector of a tensor.

Parameters

- **o_vec** – [out] The output vector.
- **session** – [in] TensorFlow session.
- **name** – [in] The name of the tensor.
- **scope** – [in] The scope of the tensor.

Template Function `deepmd::session_input_tensors(std::vector<std::pair<std::string, tensorflow::Tensor>>&, const std::vector<VALUETYPE>&, const int&, const std::vector<int>&, const std::vector<VALUETYPE>&, const double&, const std::vector<VALUETYPE>&, const std::vector<VALUETYPE>&, const deepmd::AtomMap&, const std::string)`

- Defined in file_source_api_cc_include_common.h

Function Documentation

```
template<typename MODELTYPE, typename VALUETYPE>
int deepmd::session_input_tensors(std::vector<std::pair<std::string, tensorflow::Tensor>>
                                  &input_tensors, const std::vector<VALUETYPE> &dcoord_, const
                                  int &ntypes, const std::vector<int> &dtype_, const
                                  std::vector<VALUETYPE> &dbox, const double &cell_size, const
                                  std::vector<VALUETYPE> &fparam_, const
                                  std::vector<VALUETYPE> &aparam_, const deepmd::AtomMap
                                  &atommap, const std::string scope = "")
```

Get input tensors.

Parameters

- **input_tensors** – [out] Input tensors.
- **dcoord_** – [in] Coordinates of atoms.
- **ntypes** – [in] Number of atom types.
- **dtype_** – [in] Atom types.
- **dbox** – [in] Box matrix.
- **cell_size** – [in] Cell size.
- **fparam_** – [in] Frame parameters.
- **aparam_** – [in] Atom parameters.
- **atommap** – [in] Atom map.
- **scope** – [in] The scope of the tensors.

Template Function `deepmd::session_input_tensors`(`std::vector<std::pair<std::string, tensorflow::Tensor>>&`, `const std::vector<VALUETYPE>&`, `const int&`, `const std::vector<int>&`, `const std::vector<VALUETYPE>&`, `InputNlist&`, `const std::vector<VALUETYPE>&`, `const std::vector<VALUETYPE>&`, `const deepmd::AtomMap&`, `const int`, `const int`, `const std::string`)

- Defined in `file_source_api_cc_include_common.h`

Function Documentation

```
template<typename MODELTYPE, typename VALUETYPE>
int deepmd::session_input_tensors(std::vector<std::pair<std::string, tensorflow::Tensor>>
                                &input_tensors, const std::vector<VALUETYPE> &dcoord_, const
                                int &ntypes, const std::vector<int> &dtype_, const
                                std::vector<VALUETYPE> &dbox, InputNlist &dlist, const
                                std::vector<VALUETYPE> &fparam_, const
                                std::vector<VALUETYPE> &aparam_, const deepmd::AtomMap
                                &atommap, const int nghost, const int ago, const std::string scope =
                                "")
```

Get input tensors.

Parameters

- `input_tensors` – [out] Input tensors.
- `dcoord_` – [in] Coordinates of atoms.
- `ntypes` – [in] Number of atom types.
- `dtype_` – [in] Atom types.
- `dlist` – [in] Neighbor list.
- `fparam_` – [in] Frame parameters.
- `aparam_` – [in] Atom parameters.
- `atommap` – [in] Atom map.
- `nghost` – [in] Number of ghost atoms.
- `ago` – [in] Update the internal neighbour list if ago is 0.
- `scope` – [in] The scope of the tensors.

Template Function `deepmd::session_input_tensors_mixed_type`

- Defined in `file_source_api_cc_include_common.h`

Function Documentation

```
template<typename MODELTYPE, typename VALUETYPE>
int deepmd::session_input_tensors_mixed_type(std::vector<std::pair<std::string,
    tensorflow::Tensor>> &input_tensors, const int
    &nframes, const std::vector<VALUETYPE>
    &dcoord_, const int &ntypes, const std::vector<int>
    &dtype_, const std::vector<VALUETYPE> &dbox,
    const double &cell_size, const
    std::vector<VALUETYPE> &fparam_, const
    std::vector<VALUETYPE> &aparam_, const
    deepmd::AtomMap &atommap, const std::string scope
    = "")
```

Get input tensors for mixed type.

Parameters

- **input_tensors** – [out] Input tensors.
- **nframes** – [in] Number of frames.
- **dcoord_** – [in] Coordinates of atoms.
- **ntypes** – [in] Number of atom types.
- **dtype_** – [in] Atom types.
- **dlist** – [in] Neighbor list.
- **fparam_** – [in] Frame parameters.
- **aparam_** – [in] Atom parameters.
- **atommap** – [in] Atom map.
- **nghost** – [in] Number of ghost atoms.
- **ago** – [in] Update the internal neighbour list if ago is 0.
- **scope** – [in] The scope of the tensors.

19.3.4 Typedefs

Typedef deepmd::ENERGYTYPE

- Defined in file_source_api_cc_include_common.h

Typedef Documentation

```
typedef double deepmd::ENERGYTYPE
```

Typedef deepmd::STRINGTYPE

- Defined in file_source_api_cc_include_tf_private.h

Typedef Documentation

typedef std::string deepmd::STRINGTYPE

20.3.2 Classes and Structs

Struct `deepmd_exception`

- Defined in `file_source_api_c_include_deepmd.hpp`

Inheritance Relationships

Base Type

- `public std::runtime_error`

Struct Documentation

Warning: doxygenstruct: Cannot find class “`deepmd::hpp::deepmd_exception`” in doxygen xml output for project “cc” from directory: `_build/cc/xml/`

Struct `InputNlist`

- Defined in `file_source_api_c_include_deepmd.hpp`

Struct Documentation

Warning: doxygenstruct: Cannot find class “`deepmd::hpp::InputNlist`” in doxygen xml output for project “cc” from directory: `_build/cc/xml/`

Struct `DP_DeepPot`

- Defined in `file_source_api_c_include_c_api_internal.h`

Struct Documentation

Warning: doxygenstruct: Cannot find class “`DP_DeepPot`” in doxygen xml output for project “cc” from directory: `_build/cc/xml/`

Struct `DP_DeepPotModelDevi`

- Defined in `file_source_api_c_include_c_api_internal.h`

Struct Documentation

Warning: doxygenstruct: Cannot find class “DP_DeepPotModelDevi” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Struct DP_DeepTensor

- Defined in file_source_api_c_include_c_api_internal.h

Struct Documentation

Warning: doxygenstruct: Cannot find class “DP_DeepTensor” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Struct DP_DipoleChargeModifier

- Defined in file_source_api_c_include_c_api_internal.h

Struct Documentation

Warning: doxygenstruct: Cannot find class “DP_DipoleChargeModifier” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Struct DP_Nlist

- Defined in file_source_api_c_include_c_api_internal.h

Struct Documentation

Warning: doxygenstruct: Cannot find class “DP_Nlist” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Class DeepPot

- Defined in file_source_api_c_include_deepmd.hpp

Class Documentation

Warning: doxygenclass: Cannot find class “deepmd::hpp::DeepPot” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Class DeepPotModelDevi

- Defined in file_source_api_c_include_deepmd.hpp

Class Documentation

Warning: doxygenclass: Cannot find class “deepmd::hpp::DeepPotModelDevi” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Class DeepTensor

- Defined in file_source_api_c_include_deepmd.hpp

Class Documentation

Warning: doxygenclass: Cannot find class “deepmd::hpp::DeepTensor” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Class DipoleChargeModifier

- Defined in file_source_api_c_include_deepmd.hpp

Class Documentation

Warning: doxygenclass: Cannot find class “deepmd::hpp::DipoleChargeModifier” in doxygen xml output for project “cc” from directory: _build/cc/xml/

20.3.3 Functions

Template Function _DP_DeepPotCompute

- Defined in file_source_api_c_include_deepmd.hpp

Function Documentation

Warning: doxygenfunction: Cannot find function “_DP_DeepPotCompute” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Function `_DP_DeepPotCompute< double >`

- Defined in file_source_api_c_include_deepmd.hpp

Function Documentation

Warning: doxygenfunction: Cannot find function “_DP_DeepPotCompute< double >” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Function `_DP_DeepPotCompute< float >`

- Defined in file_source_api_c_include_deepmd.hpp

Function Documentation

Warning: doxygenfunction: Cannot find function “_DP_DeepPotCompute< float >” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Template Function `_DP_DeepPotComputeMixedType`

- Defined in file_source_api_c_include_deepmd.hpp

Function Documentation

Warning: doxygenfunction: Cannot find function “_DP_DeepPotComputeMixedType” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Function `_DP_DeepPotComputeMixedType< double >`

- Defined in file_source_api_c_include_deepmd.hpp

Function Documentation

Warning: doxygenfunction: Cannot find function “_DP_DeepPotComputeMixedType< double >” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Function `_DP_DeepPotComputeMixedType< float >`

- Defined in file_source_api_c_include_deepmd.hpp

Function Documentation

Warning: doxygenfunction: Cannot find function “_DP_DeepPotComputeMixedType< float >” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Template Function `_DP_DeepPotComputeNList`

- Defined in file_source_api_c_include_deepmd.hpp

Function Documentation

Warning: doxygenfunction: Cannot find function “_DP_DeepPotComputeNList” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Function `_DP_DeepPotComputeNList< double >`

- Defined in file_source_api_c_include_deepmd.hpp

Function Documentation

Warning: doxygenfunction: Cannot find function “_DP_DeepPotComputeNList< double >” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Function `_DP_DeepPotComputeNList< float >`

- Defined in file_source_api_c_include_deepmd.hpp

Function Documentation

Warning: doxygenfunction: Cannot find function “_DP_DeepPotComputeNList< float >” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Template Function `_DP_DeepPotModelDeviComputeNList`

- Defined in file_source_api_c_include_deepmd.hpp

Function Documentation

Warning: doxygenfunction: Cannot find function “_DP_DeepPotModelDeviComputeNList” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Function `_DP_DeepPotModelDeviComputeNList< double >`

- Defined in file_source_api_c_include_deepmd.hpp

Function Documentation

Warning: doxygenfunction: Cannot find function “_DP_DeepPotModelDeviComputeNList< double >” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Function `_DP_DeepPotModelDeviComputeNList< float >`

- Defined in file_source_api_c_include_deepmd.hpp

Function Documentation

Warning: doxygenfunction: Cannot find function “_DP_DeepPotModelDeviComputeNList< float >” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Template Function `_DP_DeepTensorCompute`

- Defined in file_source_api_c_include_deepmd.hpp

Function Documentation

Warning: doxygenfunction: Cannot find function “_DP_DeepTensorCompute” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Function `_DP_DeepTensorCompute< double >`

- Defined in file_source_api_c_include_deepmd.hpp

Function Documentation

Warning: doxygenfunction: Cannot find function “_DP_DeepTensorCompute< double >” in doxygen xml output for project “cc” from directory: _build/cc/xml/

- Defined in file_source_api_c_include_c_api.h

Function Documentation

Warning: doxygenfunction: Cannot find function “DP_DipoleChargeModifierGetSelTypes” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Function DP_NewDeepPot

- Defined in file_source_api_c_include_c_api.h

Function Documentation

Warning: doxygenfunction: Cannot find function “DP_NewDeepPot” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Function DP_NewDeepPotModelDevi

- Defined in file_source_api_c_include_c_api.h

Function Documentation

Warning: doxygenfunction: Cannot find function “DP_NewDeepPotModelDevi” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Function DP_NewDeepPotWithParam

- Defined in file_source_api_c_include_c_api.h

Function Documentation

Warning: doxygenfunction: Cannot find function “DP_NewDeepPotWithParam” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Function DP_NewDeepTensor

- Defined in file_source_api_c_include_c_api.h

Function Documentation

Warning: doxygenfunction: Cannot find function “DP_NewDeepTensor” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Function DP_NewDeepTensorWithParam

- Defined in file_source_api_c_include_c_api.h

Function Documentation

Warning: doxygenfunction: Cannot find function “DP_NewDeepTensorWithParam” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Function DP_NewDipoleChargeModifier

- Defined in file_source_api_c_include_c_api.h

Function Documentation

Warning: doxygenfunction: Cannot find function “DP_NewDipoleChargeModifier” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Function DP_NewDipoleChargeModifierWithParam

- Defined in file_source_api_c_include_c_api.h

Function Documentation

Warning: doxygenfunction: Cannot find function “DP_NewDipoleChargeModifierWithParam” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Function DP_NewNlist

- Defined in file_source_api_c_include_c_api.h

Function Documentation

Warning: doxygenfunction: Cannot find function “DP_NewNlist” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Function DP_NlistCheckOK

- Defined in file_source_api_c_include_c_api.h

Function Documentation

Warning: doxygenfunction: Cannot find function “DP_NlistCheckOK” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Function DP_PrintSummary

- Defined in file_source_api_c_include_c_api.h

Function Documentation

Warning: doxygenfunction: Cannot find function “DP_PrintSummary” in doxygen xml output for project “cc” from directory: _build/cc/xml/

20.3.4 Defines

Define DP_CHECK_OK

- Defined in file_source_api_c_include_deepmd.hpp

Define Documentation

Warning: doxygendefine: Cannot find define “DP_CHECK_OK” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Define DP_NEW_OK

- Defined in file_source_api_c_include_c_api_internal.h

Define Documentation

Warning: doxygendefine: Cannot find define “DP_NEW_OK” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Define DP_REQUIRES_OK

- Defined in file_source_api_c_include_c_api_internal.h

Define Documentation

Warning: doxygendifine: Cannot find define “DP_REQUIRES_OK” in doxygen xml output for project “cc” from directory: _build/cc/xml/

20.3.5 Typedefs

Typedef DP_DeepPot

- Defined in file_source_api_c_include_c_api.h

Typedef Documentation

Warning: doxygentypedef: Cannot find typedef “DP_DeepPot” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Typedef DP_DeepPotModelDevi

- Defined in file_source_api_c_include_c_api.h

Typedef Documentation

Warning: doxygentypedef: Cannot find typedef “DP_DeepPotModelDevi” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Typedef DP_DeepTensor

- Defined in file_source_api_c_include_c_api.h

Typedef Documentation

Warning: doxygentypedef: Cannot find typedef “DP_DeepTensor” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Typedef DP_DipoleChargeModifier

- Defined in file_source_api_c_include_c_api.h

Typedef Documentation

Warning: doxygentypedef: Cannot find typedef “DP_DipoleChargeModifier” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Typedef DP_Nlist

- Defined in file_source_api_c_include_c_api.h

Typedef Documentation

Warning: doxygentypedef: Cannot find typedef “DP_Nlist” in doxygen xml output for project “cc” from directory: _build/cc/xml/

- Variable `deepmd::ElectrostaticConversion`

Namespace std

21.3.2 Classes and Structs

Struct `deepmd_exception`

- Defined in `file_source_lib_include_errors.h`

Inheritance Relationships

Base Type

- `public std::runtime_error`

Derived Type

- `public deepmd::deepmd_exception_oom (Struct deepmd_exception_oom)`

Struct Documentation

struct `deepmd_exception`

Subclassed by `deepmd::tf_exception`

Struct `deepmd_exception_oom`

- Defined in `file_source_lib_include_errors.h`

Inheritance Relationships

Base Type

- `public deepmd::deepmd_exception (Struct deepmd_exception)`

Struct Documentation

Warning: doxygenstruct: Cannot find class “`deepmd::deepmd_exception_oom`” in doxygen xml output for project “cc” from directory: `_build/cc/xml/`

Template Struct `EwaldParameters`

- Defined in `file_source_lib_include_ewald.h`

Struct Documentation

Warning: doxygenstruct: Cannot find class “deepmd::EwaldParameters” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Struct InputNlist

- Defined in file_source_lib_include_neighbor_list.h

Struct Documentation

Warning: doxygenstruct: Cannot find class “deepmd::InputNlist” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Template Struct Region

- Defined in file_source_lib_include_region.h

Struct Documentation

Warning: doxygenstruct: Cannot find class “deepmd::Region” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Template Struct DescriptSeRGPUExecuteFunctor

- Defined in file_source_lib_include_DeviceFunctor.h

Struct Documentation

Warning: doxygenstruct: Cannot find class “DescriptSeRGPUExecuteFunctor” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Template Struct GeluGPUExecuteFunctor

- Defined in file_source_lib_include_DeviceFunctor.h

Struct Documentation

Warning: doxygenstruct: Cannot find class “GeluGPUExecuteFunctor” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Template Struct GeluGradGPUExecuteFunctor

- Defined in file_source_lib_include_DeviceFunctor.h

Struct Documentation

Function Documentation

Warning: doxygenfunction: Cannot find function “build_nlist” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Function `build_nlist(std::vector<std::vector<int>>&, std::vector<std::vector<int>>&, const std::vector<double>&, const std::vector<int>&, const std::vector<int>&, const double&, const double&, const std::vector<int>&, const SimulationRegion<double>&)`

- Defined in file_source_lib_include_neighbor_list.h

Function Documentation

Warning: doxygenfunction: Cannot find function “build_nlist” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Function `build_nlist(std::vector<std::vector<int>>&, std::vector<std::vector<int>>&, const std::vector<double>&, const double&, const double&, const SimulationRegion<double> *)`

- Defined in file_source_lib_include_neighbor_list.h

Function Documentation

Warning: doxygenfunction: Cannot find function “build_nlist” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Function compute_descriptor(std::vector<double>&, std::vector<double>&, std::vector<double>&, const std::vector<double>&, const int&, const std::vector<int>&, const SimulationRegion<double>&, const bool&, const int&, const std::vector<int>&, const std::vector<int>&, const std::vector<int>&, const std::vector<int>&, const std::vector<int>&, const int, const int, const int, const int)

- Defined in file_source_lib_include_ComputeDescriptor.h

Function Documentation

Warning: doxygenfunction: Cannot find function “compute_descriptor” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Function compute_descriptor(std::vector<double>&, std::vector<double>&, std::vector<double>&, std::vector<double>&, std::vector<double>&, std::vector<double>&, std::vector<double>&, const std::vector<double>&, const int&, const std::vector<int>&, const SimulationRegion<double>&, const bool&, const int&, const std::vector<int>&, const std::vector<int>&, const std::vector<int>&, const std::vector<int>&, const int, const int, const int, const int)

- Defined in file_source_lib_include_ComputeDescriptor.h

Function Documentation

Warning: doxygenfunction: Cannot find function “compute_descriptor” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Function compute_descriptor_se_a_ef_para

- Defined in file_source_lib_include_ComputeDescriptor.h

Function Documentation

Warning: doxygenfunction: Cannot find function “compute_descriptor_se_a_ef_para” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Function compute_descriptor_se_a_ef_vert

- Defined in file_source_lib_include_ComputeDescriptor.h

Function Documentation

Warning: doxygenfunction: Cannot find function “compute_descriptor_se_a_ef_vert” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Function compute_descriptor_se_a_extf

- Defined in file_source_lib_include_ComputeDescriptor.h

Function Documentation

Warning: doxygenfunction: Cannot find function “compute_descriptor_se_a_extf” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Function compute_dRdT

- Defined in file_source_lib_include_ComputeDescriptor.h

Function Documentation

Warning: doxygenfunction: Cannot find function “compute_dRdT” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Function compute_dRdT_1

- Defined in file_source_lib_include_ComputeDescriptor.h

Function Documentation

Warning: doxygenfunction: Cannot find function “compute_dRdT_1” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Function compute_dRdT_2

- Defined in file_source_lib_include_ComputeDescriptor.h

Function Documentation

Warning: doxygenfunction: Cannot find function “compute_dRdT_2” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Function copy_coord

- Defined in file_source_lib_include_neighbor_list.h

Function Documentation

Warning: doxygenfunction: Cannot find function “copy_coord” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Template Function deepmd::build_nlist_cpu

- Defined in file_source_lib_include_neighbor_list.h

Function Documentation

Warning: doxygenfunction: Cannot find function “deepmd::build_nlist_cpu” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Template Function deepmd::build_nlist_gpu

- Defined in file_source_lib_include_neighbor_list.h

Function Documentation

Warning: doxygenfunction: Cannot find function “deepmd::build_nlist_gpu” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Template Function deepmd::compute_cell_info

- Defined in file_source_lib_include_coord.h

Function Documentation

Warning: doxygenfunction: Cannot find function “deepmd::compute_cell_info” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Function `deepmd::convert_nlist`

- Defined in file_source_lib_include_neighbor_list.h

Function Documentation

Warning: doxygenfunction: Cannot find function “deepmd::convert_nlist” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Function `deepmd::convert_nlist_gpu_device`

- Defined in file_source_lib_include_neighbor_list.h

Function Documentation

Warning: doxygenfunction: Cannot find function “deepmd::convert_nlist_gpu_device” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Template Function `deepmd::convert_to_inter_cpu`

- Defined in file_source_lib_include_region.h

Function Documentation

Warning: doxygenfunction: Cannot find function “deepmd::convert_to_inter_cpu” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Template Function `deepmd::convert_to_inter_gpu`

- Defined in file_source_lib_include_region.h

Function Documentation

Warning: doxygenfunction: Cannot find function “deepmd::convert_to_inter_gpu” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Template Function deepmd::convert_to_phys_cpu

- Defined in file_source_lib_include_region.h

Function Documentation

Warning: doxygenfunction: Cannot find function “deepmd::convert_to_phys_cpu” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Template Function deepmd::convert_to_phys_gpu

- Defined in file_source_lib_include_region.h

Function Documentation

Warning: doxygenfunction: Cannot find function “deepmd::convert_to_phys_gpu” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Template Function deepmd::copy_coord_cpu

- Defined in file_source_lib_include_coord.h

Function Documentation

Warning: doxygenfunction: Cannot find function “deepmd::copy_coord_cpu” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Template Function deepmd::copy_coord_gpu

- Defined in file_source_lib_include_coord.h

Function Documentation

Warning: doxygenfunction: Cannot find function “deepmd::copy_coord_gpu” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Function `deepmd::cos_switch(const double&, const double&, const double&)`

- Defined in `file_source_lib_include_switcher.h`

Function Documentation

Warning: doxygenfunction: Cannot find function “deepmd::cos_switch” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Function `deepmd::cos_switch(double&, double&, const double&, const double&, const double&)`

- Defined in `file_source_lib_include_switcher.h`

Function Documentation

Warning: doxygenfunction: Cannot find function “deepmd::cos_switch” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Template Function `deepmd::cprod`

- Defined in `file_source_lib_include_utilities.h`

Function Documentation

Warning: doxygenfunction: Cannot find function “deepmd::cprod” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Function `deepmd::cum_sum`

- Defined in `file_source_lib_include_utilities.h`

Function Documentation

Warning: doxygenfunction: Cannot find function “deepmd::cum_sum” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Template Function deepmd::delete_device_memory

- Defined in file_source_lib_include_gpu_cuda.h

Function Documentation

Warning: doxygenfunction: Cannot find function “deepmd::delete_device_memory” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Template Function deepmd::dot1

- Defined in file_source_lib_include_utilities.h

Function Documentation

Warning: doxygenfunction: Cannot find function “deepmd::dot1” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Template Function deepmd::dot2

- Defined in file_source_lib_include_utilities.h

Function Documentation

Warning: doxygenfunction: Cannot find function “deepmd::dot2” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Template Function deepmd::dot3

- Defined in file_source_lib_include_utilities.h

Function Documentation

Warning: doxygenfunction: Cannot find function “deepmd::dot3” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Template Function deepmd::dot4

- Defined in file_source_lib_include_utilities.h

Function Documentation

Warning: doxygenfunction: Cannot find function “deepmd::dot4” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Template Function deepmd::dotmv3

- Defined in file_source_lib_include_utilities.h

Function Documentation

Warning: doxygenfunction: Cannot find function “deepmd::dotmv3” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Function deepmd::DPGetDeviceCount

- Defined in file_source_lib_include_gpu_cuda.h

Function Documentation

Warning: doxygenfunction: Cannot find function “deepmd::DPGetDeviceCount” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Function deepmd::DPSetDevice

- Defined in file_source_lib_include_gpu_cuda.h

Function Documentation

Warning: doxygenfunction: Cannot find function “deepmd::DPSetDevice” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Template Function deepmd::env_mat_a_cpu

- Defined in file_source_lib_include_env_mat.h

Function Documentation

Warning: doxygenfunction: Cannot find function “deepmd::env_mat_a_cpu” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Template Function deepmd::env_mat_a_nvnmd_quantize_cpu

- Defined in file_source_lib_include_env_mat_nvnmd.h

Function Documentation

Warning: doxygenfunction: Cannot find function “deepmd::env_mat_a_nvnmd_quantize_cpu” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Function deepmd::env_mat_nbor_update

- Defined in file_source_lib_include_prod_env_mat.h

Function Documentation

Warning: doxygenfunction: Cannot find function “deepmd::env_mat_nbor_update” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Template Function deepmd::env_mat_r_cpu

- Defined in file_source_lib_include_env_mat.h

Function Documentation

Warning: doxygenfunction: Cannot find function “deepmd::env_mat_r_cpu” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Template Function deepmd::ewald_recp

- Defined in file_source_lib_include_ewald.h

Function Documentation

Warning: doxygenfunction: Cannot find function “deepmd::ewald_recp” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Function deepmd::filter_ftype_gpu_cuda

- Defined in file_source_lib_include_neighbor_list.h

Function Documentation

Warning: doxygenfunction: Cannot find function “deepmd::filter_ftype_gpu_cuda” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Template Function deepmd::format_nbor_list_gpu_cuda

- Defined in file_source_lib_include_fmt_nlist.h

Function Documentation

Warning: doxygenfunction: Cannot find function “deepmd::format_nbor_list_gpu_cuda” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Template Function deepmd::format_nlist_cpu

- Defined in file_source_lib_include_fmt_nlist.h

Function Documentation

Warning: doxygenfunction: Cannot find function “deepmd::format_nlist_cpu” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Function deepmd::free_nlist_gpu_device

- Defined in file_source_lib_include_neighbor_list.h

Function Documentation

Warning: doxygenfunction: Cannot find function “deepmd::free_nlist_gpu_device” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Template Function deepmd::gelu_cpu

- Defined in file_source_lib_include_gelu.h

Function Documentation

Warning: doxygenfunction: Cannot find function “deepmd::gelu_cpu” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Template Function deepmd::gelu_gpu_cuda

- Defined in file_source_lib_include_gelu.h

Function Documentation

Warning: doxygenfunction: Cannot find function “deepmd::gelu_gpu_cuda” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Template Function deepmd::gelu_grad_cpu

- Defined in file_source_lib_include_gelu.h

Function Documentation

Warning: doxygenfunction: Cannot find function “deepmd::gelu_grad_cpu” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Template Function deepmd::gelu_grad_gpu_cuda

- Defined in file_source_lib_include_gelu.h

Function Documentation

Warning: doxygenfunction: Cannot find function “deepmd::gelu_grad_gpu_cuda” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Template Function deepmd::gelu_grad_grad_cpu

- Defined in file_source_lib_include_gelu.h

Function Documentation

Warning: doxygenfunction: Cannot find function “deepmd::gelu_grad_grad_cpu” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Template Function deepmd::gelu_grad_grad_gpu_cuda

- Defined in file_source_lib_include_gelu.h

Function Documentation

Warning: doxygenfunction: Cannot find function “deepmd::gelu_grad_grad_gpu_cuda” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Template Function deepmd::init_region_cpu

- Defined in file_source_lib_include_region.h

Function Documentation

Warning: doxygenfunction: Cannot find function “deepmd::init_region_cpu” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Template Function deepmd::invsqrt

- Defined in file_source_lib_include_utilities.h

Function Documentation

Warning: doxygenfunction: Cannot find function “deepmd::invsqrt” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Function deepmd::invsqrt< double >

- Defined in file_source_lib_include_utilities.h

Function Documentation

Warning: doxygenfunction: Cannot find function “deepmd::invsqrt< double >” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Function deepmd::invsqrt< float >

- Defined in file_source_lib_include_utilities.h

Function Documentation

Warning: doxygenfunction: Cannot find function “deepmd::invsqrt< float >” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Template Function deepmd::malloc_device_memory(FPTYPE *&, const std::vector<FPTYPE>&)

- Defined in file_source_lib_include_gpu_cuda.h

Function Documentation

Warning: doxygenfunction: Cannot find function “deepmd::malloc_device_memory” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Template Function `deepmd::malloc_device_memory(FPTYPE *%, const int)`

- Defined in file_source_lib_include_gpu_cuda.h

Function Documentation

Warning: doxygenfunction: Cannot find function “deepmd::malloc_device_memory” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Template Function `deepmd::malloc_device_memory(FPTYPE *%, std::vector<FPTYPE> &)`

- Defined in file_source_lib_include_gpu_rocm.h

Function Documentation

Warning: doxygenfunction: Cannot find function “deepmd::malloc_device_memory” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Template Function `deepmd::malloc_device_memory_sync(FPTYPE *%, const std::vector<FPTYPE> &)`

- Defined in file_source_lib_include_gpu_cuda.h

Function Documentation

Warning: doxygenfunction: Cannot find function “deepmd::malloc_device_memory_sync” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Template Function `deepmd::malloc_device_memory_sync(FPTYPE *%, const FPTYPE *, const int)`

- Defined in file_source_lib_include_gpu_cuda.h

Function Documentation

Warning: doxygenfunction: Cannot find function “deepmd::malloc_device_memory_sync” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Template Function deepmd::malloc_device_memory_sync(FPTYPE *%, std::vector<FPTYPE>%)

- Defined in file_source_lib_include_gpu_rocm.h

Function Documentation

Warning: doxygenfunction: Cannot find function “deepmd::malloc_device_memory_sync” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Template Function deepmd::map_aparam_cpu

- Defined in file_source_lib_include_map_aparam.h

Function Documentation

Warning: doxygenfunction: Cannot find function “deepmd::map_aparam_cpu” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Function deepmd::max_numneigh

- Defined in file_source_lib_include_neighbor_list.h

Function Documentation

Warning: doxygenfunction: Cannot find function “deepmd::max_numneigh” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Template Function deepmd::memcpy_device_to_host(const FPTYPE *, std::vector<FPTYPE>%)

- Defined in file_source_lib_include_gpu_cuda.h

Function Documentation

Warning: doxygenfunction: Cannot find function “deepmd::memcpy_device_to_host” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Template Function `deepmd::memcpy_device_to_host(const FPTYPE *, FPTYPE *, const int)`

- Defined in `file_source_lib_include_gpu_cuda.h`

Function Documentation

Warning: doxygenfunction: Cannot find function “deepmd::memcpy_device_to_host” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Template Function `deepmd::memcpy_device_to_host(FPTYPE *, std::vector<FPTYPE>&)`

- Defined in `file_source_lib_include_gpu_rocm.h`

Function Documentation

Warning: doxygenfunction: Cannot find function “deepmd::memcpy_device_to_host” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Template Function `deepmd::memcpy_host_to_device(FPTYPE *, const std::vector<FPTYPE>&)`

- Defined in `file_source_lib_include_gpu_cuda.h`

Function Documentation

Warning: doxygenfunction: Cannot find function “deepmd::memcpy_host_to_device” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Template Function `deepmd::memcpy_host_to_device(FPTYPE *, const FPTYPE *, const int)`

- Defined in `file_source_lib_include_gpu_cuda.h`

Function Documentation

Warning: doxygenfunction: Cannot find function “deepmd::memcpy_host_to_device” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Template Function deepmd::memcpy_host_to_device(FPTYPE *, std::vector<FPTYPE>&)

- Defined in file_source_lib_include_gpu_rocm.h

Function Documentation

Warning: doxygenfunction: Cannot find function “deepmd::memcpy_host_to_device” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Template Function deepmd::memset_device_memory

- Defined in file_source_lib_include_gpu_cuda.h

Function Documentation

Warning: doxygenfunction: Cannot find function “deepmd::memset_device_memory” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Template Function deepmd::normalize_coord_cpu

- Defined in file_source_lib_include_coord.h

Function Documentation

Warning: doxygenfunction: Cannot find function “deepmd::normalize_coord_cpu” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Template Function deepmd::normalize_coord_gpu

- Defined in file_source_lib_include_coord.h

Function Documentation

Warning: doxygenfunction: Cannot find function “deepmd::normalize_coord_gpu” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Template Function deepmd::pair_tab_cpu

- Defined in file_source_lib_include_pair_tab.h

Function Documentation

Warning: doxygenfunction: Cannot find function “deepmd::pair_tab_cpu” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Template Function deepmd::prod_env_mat_a_cpu

- Defined in file_source_lib_include_prod_env_mat.h

Function Documentation

Warning: doxygenfunction: Cannot find function “deepmd::prod_env_mat_a_cpu” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Template Function deepmd::prod_env_mat_a_gpu_cuda

- Defined in file_source_lib_include_prod_env_mat.h

Function Documentation

Warning: doxygenfunction: Cannot find function “deepmd::prod_env_mat_a_gpu_cuda” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Template Function deepmd::prod_env_mat_a_nvnmmd_quantize_cpu

- Defined in file_source_lib_include_prod_env_mat_nvnmmd.h

Function Documentation

Warning: doxygenfunction: Cannot find function “deepmd::prod_env_mat_a_nvnmmd_quantize_cpu” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Template Function deepmd::prod_env_mat_r_cpu

- Defined in file_source_lib_include_prod_env_mat.h

Function Documentation

Warning: doxygenfunction: Cannot find function “deepmd::prod_env_mat_r_cpu” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Template Function deepmd::prod_env_mat_r_gpu_cuda

- Defined in file_source_lib_include_prod_env_mat.h

Function Documentation

Warning: doxygenfunction: Cannot find function “deepmd::prod_env_mat_r_gpu_cuda” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Template Function deepmd::prod_force_a_cpu

- Defined in file_source_lib_include_prod_force.h

Function Documentation

Warning: doxygenfunction: Cannot find function “deepmd::prod_force_a_cpu” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Template Function deepmd::prod_force_a_gpu_cuda

- Defined in file_source_lib_include_prod_force.h

Function Documentation

Warning: doxygenfunction: Cannot find function “deepmd::prod_force_a_gpu_cuda” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Template Function deepmd::prod_force_grad_a_cpu

- Defined in file_source_lib_include_prod_force_grad.h

Function Documentation

Warning: doxygenfunction: Cannot find function “deepmd::prod_force_grad_a_cpu” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Template Function deepmd::prod_force_grad_a_gpu_cuda

- Defined in file_source_lib_include_prod_force_grad.h

Function Documentation

Warning: doxygenfunction: Cannot find function “deepmd::prod_force_grad_a_gpu_cuda” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Template Function deepmd::prod_force_grad_r_cpu

- Defined in file_source_lib_include_prod_force_grad.h

Function Documentation

Warning: doxygenfunction: Cannot find function “deepmd::prod_force_grad_r_cpu” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Template Function deepmd::prod_force_grad_r_gpu_cuda

- Defined in file_source_lib_include_prod_force_grad.h

Function Documentation

Warning: doxygenfunction: Cannot find function “deepmd::prod_force_grad_r_gpu_cuda” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Template Function deepmd::prod_force_r_cpu

- Defined in file_source_lib_include_prod_force.h

Function Documentation

Warning: doxygenfunction: Cannot find function “deepmd::prod_force_r_cpu” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Template Function deepmd::prod_force_r_gpu_cuda

- Defined in file_source_lib_include_prod_force.h

Function Documentation

Warning: doxygenfunction: Cannot find function “deepmd::prod_force_r_gpu_cuda” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Template Function deepmd::prod_virial_a_cpu

- Defined in file_source_lib_include_prod_virial.h

Function Documentation

Warning: doxygenfunction: Cannot find function “deepmd::prod_virial_a_cpu” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Template Function deepmd::prod_virial_a_gpu_cuda

- Defined in file_source_lib_include_prod_virial.h

Function Documentation

Warning: doxygenfunction: Cannot find function “deepmd::prod_virial_a_gpu_cuda” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Template Function deepmd::prod_virial_grad_a_cpu

- Defined in file_source_lib_include_prod_virial_grad.h

Function Documentation

Warning: doxygenfunction: Cannot find function “deepmd::prod_virial_grad_a_cpu” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Template Function deepmd::prod_virial_grad_a_gpu_cuda

- Defined in file_source_lib_include_prod_virial_grad.h

Function Documentation

Warning: doxygenfunction: Cannot find function “deepmd::prod_virial_grad_a_gpu_cuda” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Template Function deepmd::prod_virial_grad_r_cpu

- Defined in file_source_lib_include_prod_virial_grad.h

Function Documentation

Warning: doxygenfunction: Cannot find function “deepmd::prod_virial_grad_r_cpu” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Template Function deepmd::prod_virial_grad_r_gpu_cuda

- Defined in file_source_lib_include_prod_virial_grad.h

Function Documentation

Warning: doxygenfunction: Cannot find function “deepmd::prod_virial_grad_r_gpu_cuda” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Template Function deepmd::prod_virial_r_cpu

- Defined in file_source_lib_include_prod_virial.h

Function Documentation

Warning: doxygenfunction: Cannot find function “deepmd::prod_virial_r_cpu” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Template Function deepmd::prod_virial_r_gpu_cuda

- Defined in file_source_lib_include_prod_virial.h

Function Documentation

Warning: doxygenfunction: Cannot find function “deepmd::prod_virial_r_gpu_cuda” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Template Function deepmd::soft_min_switch_cpu

- Defined in file_source_lib_include_soft_min_switch.h

Function Documentation

Warning: doxygenfunction: Cannot find function “deepmd::soft_min_switch_cpu” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Template Function deepmd::soft_min_switch_force_cpu

- Defined in file_source_lib_include_soft_min_switch_force.h

Function Documentation

Warning: doxygenfunction: Cannot find function “deepmd::soft_min_switch_force_cpu” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Template Function deepmd::soft_min_switch_force_grad_cpu

- Defined in file_source_lib_include_soft_min_switch_force_grad.h

Function Documentation

Warning: doxygenfunction: Cannot find function “deepmd::soft_min_switch_force_grad_cpu” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Template Function deepmd::soft_min_switch_virial_cpu

- Defined in file_source_lib_include_soft_min_switch_virial.h

Function Documentation

Warning: doxygenfunction: Cannot find function “deepmd::soft_min_switch_virial_cpu” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Template Function deepmd::soft_min_switch_virial_grad_cpu

- Defined in file_source_lib_include_neighbor_list.h

Function Documentation

Warning: doxygenfunction: Cannot find function “deepmd::use_nlist_map” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Template Function deepmd::volume_cpu

- Defined in file_source_lib_include_region.h

Function Documentation

Warning: doxygenfunction: Cannot find function “deepmd::volume_cpu” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Template Function deepmd::volume_gpu

- Defined in file_source_lib_include_region.h

Function Documentation

Warning: doxygenfunction: Cannot find function “deepmd::volume_gpu” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Template Function dotmulflt_nvnmmd

- Defined in file_source_lib_include_env_mat_nvnmmd.h

Function Documentation

Warning: doxygenfunction: Cannot find function “dotmulflt_nvnmmd” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Function DPAssert(cudaError_t, const char *, int, bool)

- Defined in file_source_lib_include_gpu_cuda.h

Function Documentation

Warning: doxygenfunction: Cannot find function “DPAssert” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Function DPAssert(hipError_t, const char *, int, bool)

- Defined in file_source_lib_include_gpu_rocm.h

Function Documentation

Warning: doxygenfunction: Cannot find function “DPAssert” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Function `env_mat_a`

- Defined in `file_source_lib_include_env_mat.h`

Function Documentation

Warning: doxygenfunction: Cannot find function “env_mat_a” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Function `env_mat_r`

- Defined in `file_source_lib_include_env_mat.h`

Function Documentation

Warning: doxygenfunction: Cannot find function “env_mat_r” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Template Function `find_max_expo(int64_t&, T *, int64_t)`

- Defined in `file_source_lib_include_env_mat_nvnmmd.h`

Function Documentation

Warning: doxygenfunction: Cannot find function “find_max_expo” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Template Function `find_max_expo(int64_t&, T *, int64_t, int64_t)`

- Defined in `file_source_lib_include_env_mat_nvnmmd.h`

Function Documentation

Warning: doxygenfunction: Cannot find function “find_max_expo” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Template Function `format_nlist_i_cpu`

- Defined in `file_source_lib_include_fmt_nlist.h`

Function Documentation

Warning: doxygenfunction: Cannot find function “format_nlist_i_cpu” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Function `format_nlist_i_fill_a`

- Defined in `file_source_lib_include_fmt_nlist.h`

Function Documentation

Warning: doxygenfunction: Cannot find function “format_nlist_i_fill_a” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Template Function `mul_ftl_nvnmmd`

- Defined in `file_source_lib_include_env_mat_nvnmmd.h`

Function Documentation

Warning: doxygenfunction: Cannot find function “mul_ftl_nvnmmd” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Function `nborAssert(cudaError_t, const char *, int, bool)`

- Defined in `file_source_lib_include_gpu_cuda.h`

Function Documentation

Warning: doxygenfunction: Cannot find function “nborAssert” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Function `nborAssert(hipError_t, const char *, int, bool)`

- Defined in file_source_lib_include_gpu_rocm.h

Function Documentation

Warning: doxygenfunction: Cannot find function “nborAssert” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Function `omp_get_num_threads`

- Defined in file_source_lib_include_ewald.h

Function Documentation

Warning: doxygenfunction: Cannot find function “omp_get_num_threads” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Function `omp_get_thread_num`

- Defined in file_source_lib_include_ewald.h

Function Documentation

Warning: doxygenfunction: Cannot find function “omp_get_thread_num” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Template Function `split_ft`

- Defined in file_source_lib_include_env_mat_nvnmmd.h

Function Documentation

Warning: doxygenfunction: Cannot find function “splitflt” in doxygen xml output for project “cc” from directory: _build/cc/xml/

21.3.5 Variables

Variable `deepmd::ElectrostaticConversion`

- Defined in file_source_lib_include_ewald.h

Variable Documentation

Warning: doxygenvariable: Cannot find variable “deepmd::ElectrostaticConversion” in doxygen xml output for project “cc” from directory: _build/cc/xml/

21.3.6 Defines

Define `DPErrcheck`

- Defined in file_source_lib_include_gpu_cuda.h

Define Documentation

Warning: doxygendifine: Cannot find define “DPErrcheck” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Define `DPErrcheck`

- Defined in file_source_lib_include_gpu_rocm.h

Define Documentation

Warning: doxygendifine: Cannot find define “DPErrcheck” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Define `FLT_MASK`

- Defined in file_source_lib_include_env_mat_nvnmmd.h

Define Documentation

Warning: doxygendefine: Cannot find define “FLT_MASK” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Define GPU_MAX_NBOR_SIZE

- Defined in file_source_lib_include_gpu_cuda.h

Define Documentation

Warning: doxygendefine: Cannot find define “GPU_MAX_NBOR_SIZE” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Define GPU_MAX_NBOR_SIZE

- Defined in file_source_lib_include_gpu_rocm.h

Define Documentation

Warning: doxygendefine: Cannot find define “GPU_MAX_NBOR_SIZE” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Define MOASPNDIM

- Defined in file_source_lib_include_SimulationRegion.h

Define Documentation

Warning: doxygendefine: Cannot find define “MOASPNDIM” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Define NBIT_CUTF

- Defined in file_source_lib_include_env_mat_nvnmdd.h

Define Documentation

Warning: doxygendefine: Cannot find define “NBIT_CUTF” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Define NBIT_FLTF

- Defined in file_source_lib_include_env_mat_nvnmd.h

Define Documentation

Warning: doxygendefine: Cannot find define “NBIT_FLTF” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Define nborErrcheck

- Defined in file_source_lib_include_gpu_cuda.h

Define Documentation

Warning: doxygendefine: Cannot find define “nborErrcheck” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Define nborErrcheck

- Defined in file_source_lib_include_gpu_rocm.h

Define Documentation

Warning: doxygendefine: Cannot find define “nborErrcheck” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Define SQRT_2_PI

- Defined in file_source_lib_include_device.h

Define Documentation

Warning: doxygendefine: Cannot find define “SQRT_2_PI” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Define TPB

- Defined in file_source_lib_include_device.h

Define Documentation

Warning: doxygendefine: Cannot find define “TPB” in doxygen xml output for project “cc” from directory: _build/cc/xml/

21.3.7 Typedefs

Typedef int_64

- Defined in file_source_lib_include_device.h

Typedef Documentation

Warning: doxygentypedef: Cannot find typedef “int_64” in doxygen xml output for project “cc” from directory: _build/cc/xml/

Typedef uint_64

- Defined in file_source_lib_include_device.h

Typedef Documentation

Warning: doxygentypedef: Cannot find typedef “uint_64” in doxygen xml output for project “cc” from directory: _build/cc/xml/

23.2 Other Credits

- Zhang ZiXuan for designing the Deepmodeling logo.
- Everyone on the Deepmodeling mailing list for contributing to many discussions and decisions!

LOGO

The logo of DeePMD-kit is a beaver. Beavers were widely distributed in Europe and Asia but became nearly extinct due to hunting. Listed as a first-class state-protected animal in China, the population of beavers in China is less than the giant pandas. We hope that users of DeePMD-kit can enhance the awareness to protect beavers.
